

STRATEGICALLY LOCATED in CANADA'S MOST PROLIFIC GOLD BELT with 43-101 OUNCES IN THE GROUND

Projects in Quebec and Ontario, in established and active mining camps, offer shareholders 43-101 ounces in the ground in secure jurisdictions, with blue-sky potential a both the resource properties and in additional exploration projects.

Quebec - Resources with Blue Sky

The New Alger Project is strategically located on 1.4 kms of the Cadillac Break, a massive geological structure that boasts over 45 million ounces of gold (produced, reserves and resources). New Alger is positioned in the heart of this action, with best-of-breed neighbours in the LaRonde Mine (~4m oz produced to date) to the north, Agnico-Eagle's extremely deep flagship asset, and the former O'Brien Mine (+500,000 oz. produced at ~15 g/t) structurally joined on the east with shared vein systems in the Cadillac Break. Both neighbouring mines are deeper than the 340m shaft of the former Thompson-Cadillac Mine, part of the New Alger Project.

Thompson-Cadillac Mine Area Inferred Resource - 237,000 ounces of gold at a grade of 2.1 g/t contained in 3,505,000 tonnes, from surface to only 200m depth. Below this an Exploration Target, based upon gold results requiring additional drilling, of a potential quantity and grade of mineralization of between 1.7 million and 2.2 million tonnes, with an estimated grade range of between 2.0 and 2.35 g/t Au, this sits at a depth of between 200 and 350m Pontiac Vein System Renforth has "re-discovered" surface gold veins south

of the former mine area. The Pontiac Vein System is a corridor ~100m thick, which has been traced over ~450m strike length on surface to date, which contains a series of gold bearing en-echelon quartz veins, drill intersected and surface sampled. Geophysics indicate additional strike length.

The Parbec Project to the east is tied on to the enormous Canadian Malartic open pit of Agnico/Yamana, on strike of the former East Amphi Mine portion of that property. Parbec encompasses 1.6 kms of the Cadillac Break, with a decline in place to ~100m vertical depth. The Parbec gold resource starts at surface and extends to ~300m depth in places, it consists of an inferred resource of 514,108 ounces at a grade of 2.01g/t contained in 7,256,872t and indicated resource of 33,592 ounces at a grade of 3.62g/t in 263,230t. Parbec is open along strike and at depth, also with potential within the defined area of mineralization to drill and add to the resource upon receipt of positive results.

Quebec - Blue Sky Exploration

Renforth has two additional gold bearing exploration properties in the Abitibi, the West Malartic Project and the Denain Project. West Malartic is a drill-tested gold bearing exploration property, contiguous to the western border of the Canadian Malartic super pit with porphyry dykes in an ENE-WSW orientation evident in magnetics, similar to those at Canadian Malartic. The Denain Project, is a gold bearing property encompassing the eastern end of the Cadillac Break at the Grenville Front, an entirely under-explored environment on strike from the Chimo Mine.

Market Information (June 8, 2017)

Table with 2 columns: Metric (Trading Symbol, Current Price, 52 Week Hi/Low, Outstanding Shares, Market Capitalization, Web Site) and Value (CNSX:RFR, \$0.075, \$0.02 - \$0.08, 91,034,372, ~6.8 million, www.renforthresources.com)

Renforth is a fiscally conscious company with a low burn rate, management is a shareholder and the stock is tightly held by sophisticated shareholders who are knowledgeable of the exploration industry. The Company is focused on building shareholder value by the definition of gold deposits in a very active gold mining camp where processing infrastructure can be accessed at nearby operating mills, reducing capital costs.

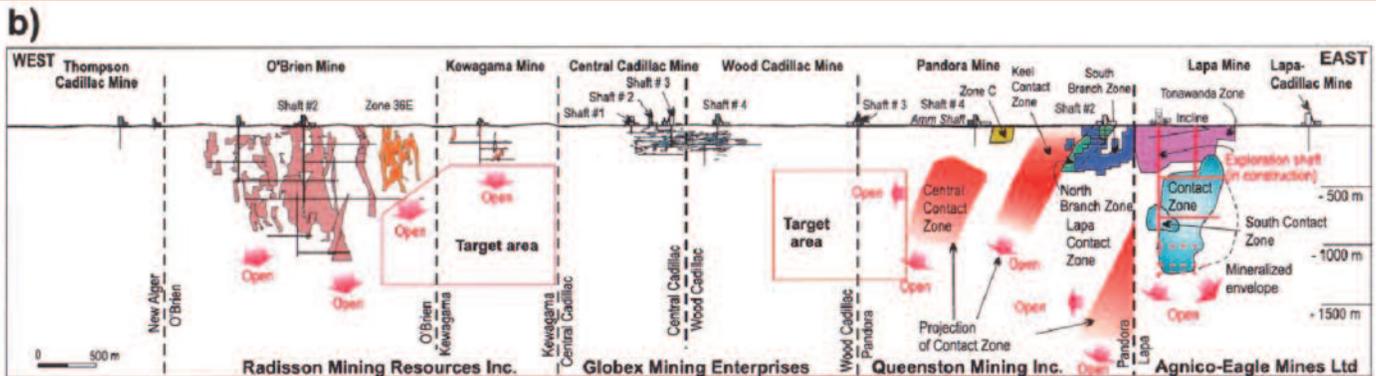

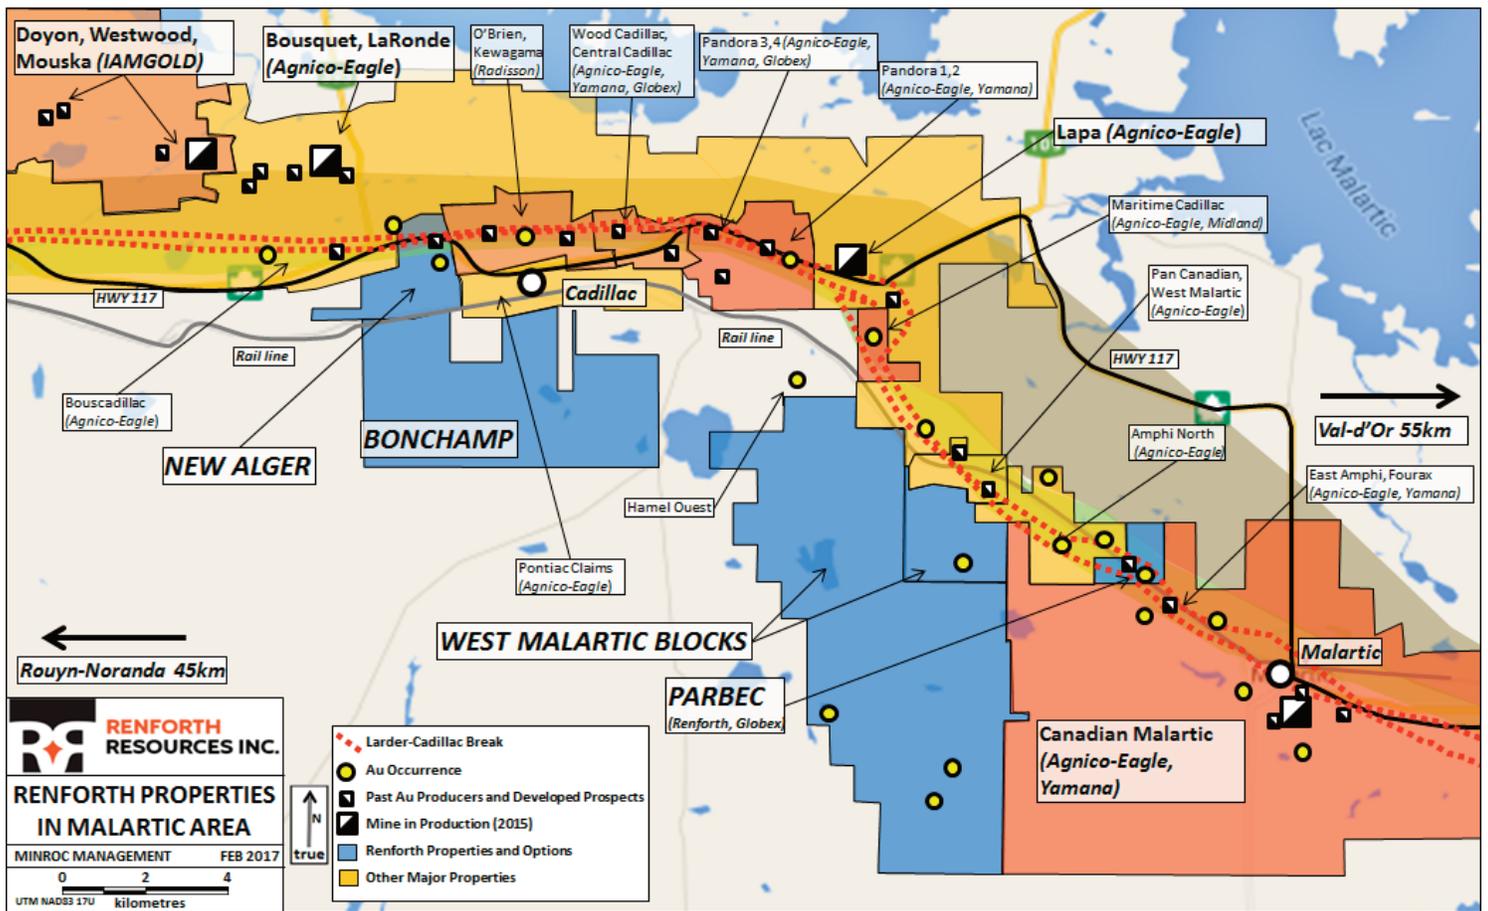

FIGURE 2 - Vertical sections showing the location of orebodies and showings in the Cadillac mining camp: a) North section (Mouska, Doyon, Bousquet and LaRonde mines), b) South section (Cadillac Fault). No vertical exaggeration. The data used to produce this figure was provided by several mining companies.

The image above, taken from a Quebec Government publication PRO 2005-02, clearly illustrates the depth potential of New Alger's Thomson Cadillac Mine, relative to the adjacent O'Brien Mine, with shared vein systems.

## Ontario - Blue Sky Exploration

The **Nixon-Bartleman Project** in the West Timmins area of Ontario is located on the Porcupine-Destor deformation zone, the key structural control for gold mineralization in the area. The property, comprised of patents surrounded by staked claims, has a history of sporadic exploration as early as the 1920's, including operating as the Jobert Keefer Gold Mine, with significant gold results obtained historically. Recently the property saw modern drilling and various surveys, however there has not been, to date, a consolidation and compilation of all of the data available on the property. Renforth has carried out an initial field program which validated the presence of gold on the property and investigated previous channel sites, trenches and pit locations, in addition to discovering previously unknown veining in a new location on the property.
