1.0 SUMMARY

Minroc Management Limited (Minroc) was retained by Renforth Resources Inc. (Renforth) to complete a series of diamond drill programs in 2021 in the Victoria area of the Surimeau Property near Malartic, Québec. The purpose of this report is to present all material technical information pertaining to this exploration work for assessment filing.

Renforth Resources Inc. (Renforth) is an exploration company and is headquartered at 269-1099 Kingston Road, Pickering, Ontario, Canada.

2.0 INTRODUCTION

Minroc Management Limited (Minroc) was retained by Renforth Resources Inc. (Renforth) to complete a series of drill programs in 2021 in the Victoria area of the Surimeau Property near Malartic, Québec. The purpose of these drill programs was to confirm poorly-documented historic drillhole results, test and better locate strike continuations inferred from geophysics, undercut trenches and outcrops with known mineralization, and build upon the limited 2020 Minroc drilling. All material technical information pertaining to this exploration work is presented for assessment filing.

Drill holes were planned to test: 1) the Victoria magnetic structure, interpreted as an east-west suite of volcano sedimentary units which are fertile for massive sulphides and intruded with nickeliferous ultramafic sills, set within the wider Pontiac greywackes and/or mica schists; 2) to test the entire width of the structure; 3) to extend mineralization along strike; and 4) to test features and mineralization observed on surface from prospecting and trenching.

Drilling took place in three programs, the first program took place from March 24th to April 16th, 2021, the second took place from June 14th to July 15th, 2021, and the third from December 3rd to December 13th, 2021. A total of 3,456 m was drilled from March to April 2021, 773.2 m was drilled June to July 2021 and 1,203 m was drilled in December 2021, totaling 5,432.2 m drilled between the three programs. A total of 4,507 samples were taken, including 571 QA/QC samples.

2.1 Terms of Reference

The following list presents the terms of reference used in this report.

Table 1 Terms of Reference

Abbreviation or term	Definition
°	Degrees (angle)
°C	Degrees Celsius (temperature)
Ag	Silver (chemical symbol)
Au	Gold (chemical symbol)
CDC	Claim Designé sur Carte (Québec mining claim type)
CIM	Canadian institute of Mining, Minerals and Petroleum
Cu	Copper (chemical symbol)
DDH	Diamond Drillhole
EM	Electromagnetic (geophysical conductivity survey)
g/t	Grams per tonne (concentration)
Ga	Billion years (Giga-annum, age)
Ha	Hectare (area)
HFR	High Frequency Response (Beep Mat conductivity data reading)
IP	Induced Polarization (geophysical survey technique)
JORC	Joint Ore Reserves Committee (Australian mineral resource reporting code)
JV	Joint Venture
kg	Kilogram (weight)
km	Kilometre (distance)
km^2	Square kilometre (area)
Kt	Kilotonne (thousand tonnes, weight)
m	Metre (distance)
MERN	Ministere d'Environnement et Ressources Naturelles (Québec ministry)
mm	Millimetre (distance)
Mt	Megatonne (million tonnes, weight)
Ni	Nickel (chemical symbol)
NI 43-101	National Instrument 43-101 (Canadian mineral resource reporting code)
NSR	Net Smelter Return (type of royalty)
NSV	No Significant Values
Oz	Ounce (weight)
P. Geo	Professional Geoscientist (as accredited in Canada)
Pb	Lead (chemical symbol)
po	Pyrrhotite (iron sulphide mineral)
py	Pyrite (iron sulphide mineral)
QA/QC	Quality Assurance and Quality Control
SEDAR	System for Electronic Document Analysis and Retrieval (Canadian securities document filing system)
SIGEOM	Système d'information géominière (Québec online geoscience and exploration data repository)

sph	Sphalerite (zinc-iron sulphide mineral)
t	Tonne (weight)
UTM	Universal Transverse Mercator (coordinate reference system)
VLF	Very Low Frequency (electromagnetic survey method)
VMS	Volcanogenic Massive Sulphide (base metal deposit type)
Zn	Zinc (chemical symbol)

3.0 PROPERTY DESCRIPTION AND LOCATION

3.1 Location

The Surimeau Property lies within NTS Sheets 32D/01 and 32D/02. The majority of the Property is within 32D/01, in Cadillac and Surimeau Townships, while the eastern portion (the “Colonie” target area) is within Fournière Township. The “Huston” northwest extension is in Bousquet township and NTS sheet 32D/02. The boundary between the Rouyn-Noranda and Vallée-de-l’Or municipalities runs north-south through the west of the Property.

The centre of the Property is at about 703,000mE 5,330,000mN, UTM NAD83 zone 17U.

3.2 Description of Mineral Tenure

The Surimeau Property consists of 535 “CDC” map-staked Mining Claims with a total area of 30,326 hectares. The claims are contiguous. All claims form standard map-staked rectangles except for two in Fournière Township which are cut at the boundary of a protected wetland area.

Several claims in the north of the Property have work excesses due to previous work completed by SOQUEM and Minroc in 2018/19 when they were part of the Malartic West property.

3.3 Nature of Issuer’s Title

In Quebec, Mineral Claims confer upon the holder the exclusive right to explore for all mineral substances discluding petroleum, gas, brine, and surficial deposits such as sand, gravel and clay. A Mineral Claim does not confer any surface rights save for access for the purpose of exploration in accordance with the Quebec Mining Act.

Claims endure for two years and can be renewed following the filing of reports of exploration work meeting the required value for assessment credits, or making an in-lieu payment of twice the required assessment credit value.

3.4 Royalties

To the best of the authors’ knowledge, there are no royalties, back-in rights, payments, or other agreements or encumbrances which would affect the Issuer’s title upon the property or ability to perform work upon it.

3.5 Environmental liabilities

To the best of the authors’ knowledge, there are no environmental liabilities which would affect the Issuer’s title upon the property or ability to perform work upon it.

3.6 Permits Required

Drilling, trenching and other exploration activities may require the cutting of trees for access routes, drill pads or trenching areas. A permit from the MERN is required prior to beginning this work. Plans of anticipated pads and routes must be submitted to the Ministry and approved. Approval time is generally in the order of four to six weeks.

3.7 Other Factors

The property lies within a region covered by an agreement between the government of Quebec and the Abitibiwinni First Nation of Pikogan near Amos, Quebec. It is recommended that Renforth keep the Pikogan community abridged of any major exploration plans on the Property particularly those which may disrupt traditional hunting or trapping rights.

Parts of the southeastern end of the Property, and key access routes, are beneath private land. Communication with the landowner is recommended ahead of any planned exploration.

A small area at the southeastern end of the Property abuts a protected wetland.

Table 2 Surimeau Claim Details

Claim	Area Ha	Staked	Date Due	Work Done	Work Req'd	Holder	Notes

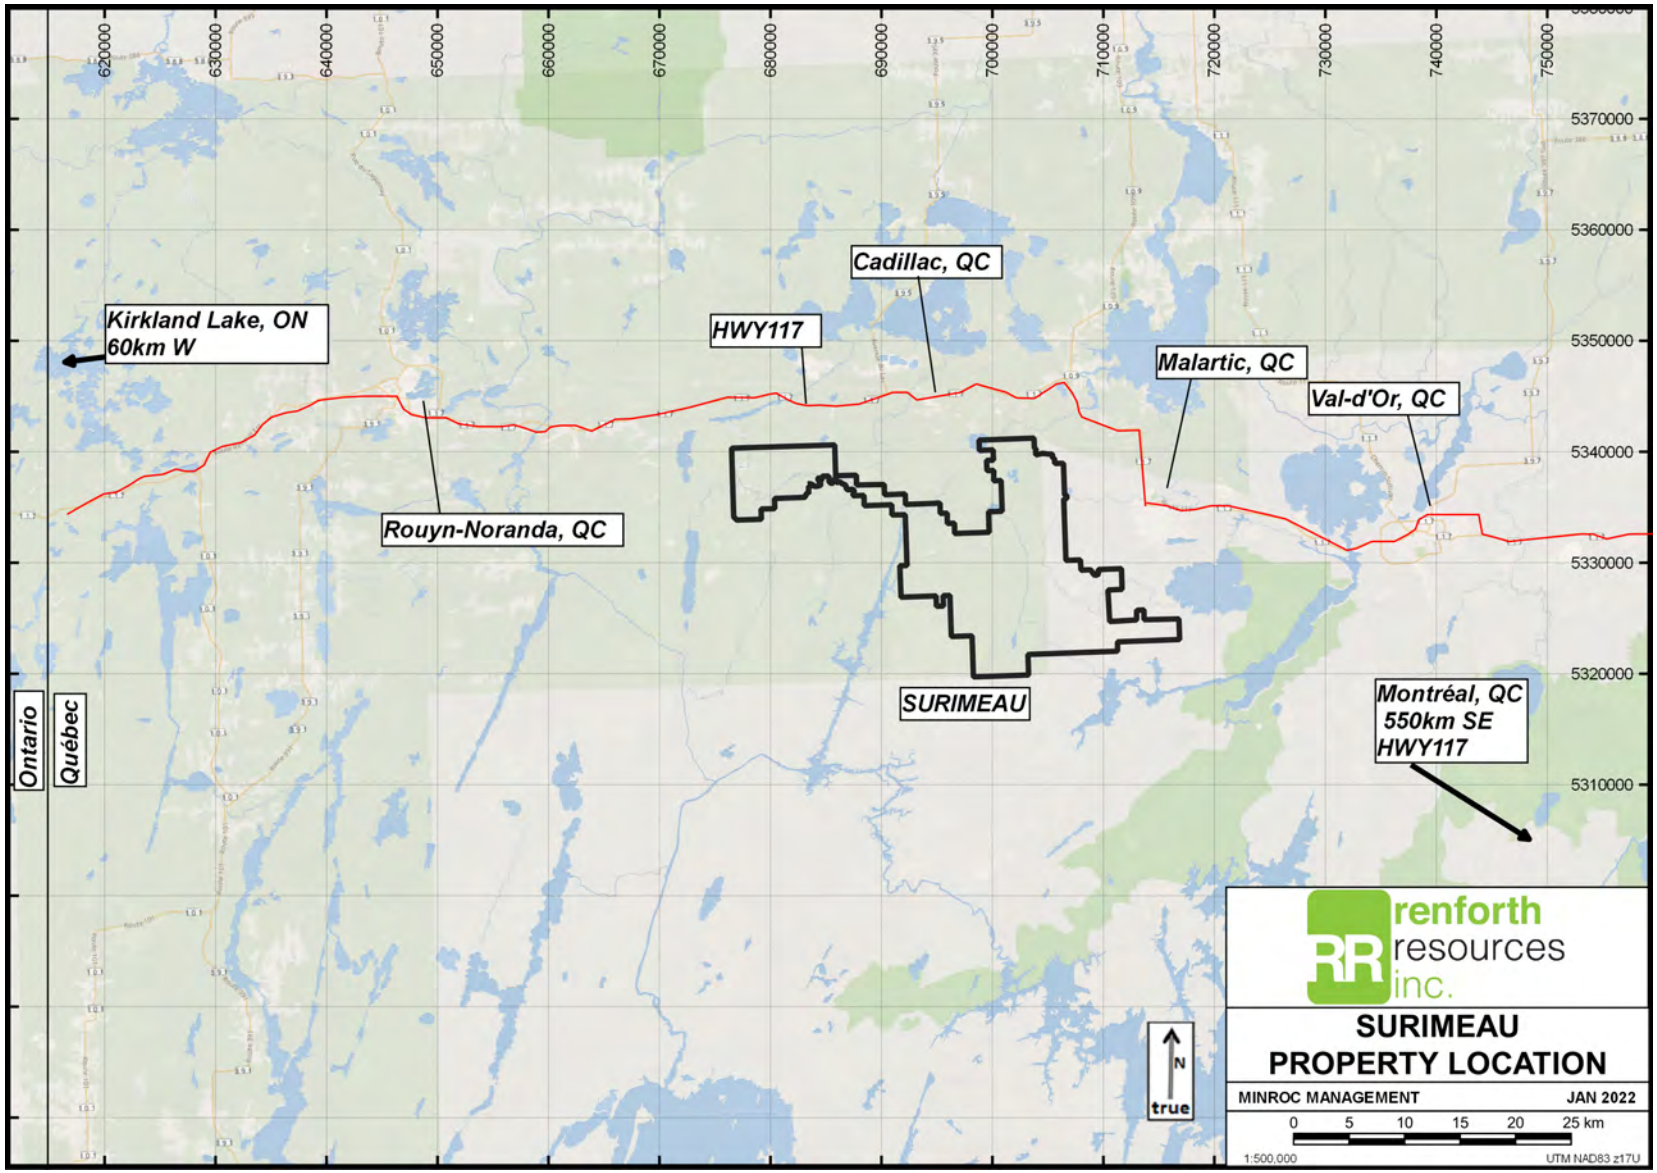

Figure 1 Property Location

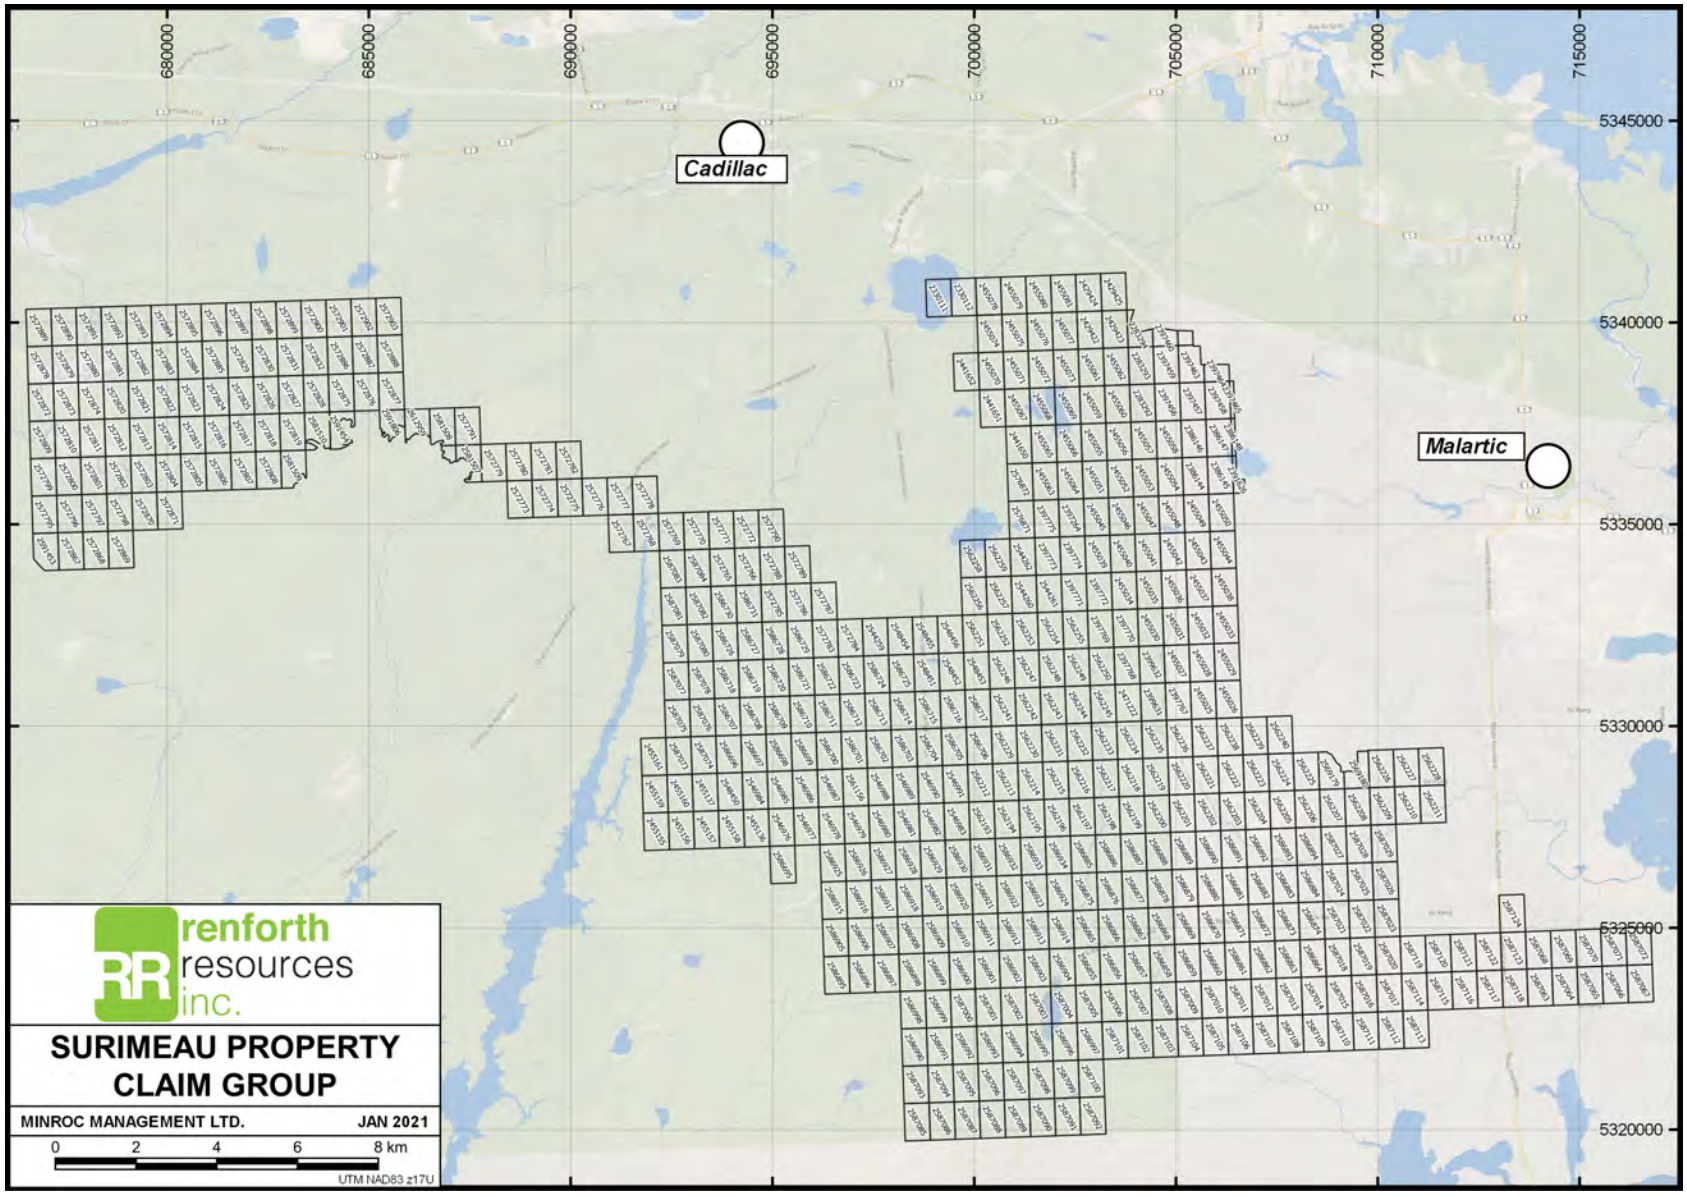

Figure 2 Claim Details

4.0 ACCESSIBILITY, CLIMATE, LOCAL RESOURCES, INFRASTRUCTURE & PHYSIOGRAPHY

4.1 Topography, Elevation and Vegetation

The Property terrain is an undulating peneplain typical of the Canadian Shield. Elevation varies from a low of 312 m to a high of 390 m. The lowest area is in the southeast corner by the Riviere Fournière. The south-centre of the property is generally flat, swampy and low-lying, the western areas particularly around the Victoria prospect are hilly. The northern limit of the Property has the highest elevations in the area of the granodiorite Surimau batholith and an east-west dyke.

Lakes on the property include Lac Surimau in the northwest corner and the smaller Lacs Lalonde (or Laronde) and Dupuis in the west-centre. These drain into the Riviere Surimau which flows southwards. The eastern edge of the Property is drained by the Riviere Fournière.

The Arctic/Atlantic watershed passes through the western part of the Property a short distance west of the Rapide Sept road – the east and west sides eventually draining into the Harricana and Ottawa Rivers respectively.

Most of the Property is covered by mixed spruce, fir and birch. Most of the Property has been subjected to forestry activity in recent years and is at varying stages of regrowth.

4.2 Accessibility

The eastern half of the Property can be accessed using ATV trails and logging roads from Malartic. The western half, including the Victoria and Lalonde areas, can easily be accessed using the Rapide-Sept gravel road which runs south from the town of Cadillac, through the Property. Logging roads and ATV trails provide access from either side of this road.

Parts of the south-centre of the Property are difficult to access outside winter, with trails disappearing into wet ground.

4.3 Proximity to Infrastructure

The Property can be accessed by road from regional towns using highway 117 which runs through the nearby small towns of Malartic and Cadillac. Gravel roads, logging roads and ATV trails run onto the property from both of these towns.

The Hydro-Quebec powerline from the Rapide-Sept hydroelectric dam runs through the Lalonde and Victoria areas on the Property.

The region has a large mining and exploration industry and there is no shortage of contractors and supply businesses that are tailored towards exploration work.

4.4 Climate

The climate is typical of the Abitibi region which has a Humid Continental (Dfb) climate in the Koeppen system. The winters extend from November to April and a considerable amount of snowfall can be expected; when built up this snow can exceed a meter in depth. For short periods between mid-January to the end of February, the temperature may fall to approximately -40° C. Summers are short with temperatures in the range of 5

to 35° C, the latter occurring from mid-July to mid-August. Aside from brief freeze-up and breakup periods, the climate is amenable to exploration year-round.

5.0 HISTRY

5.1 Prior Ownership

Renforth's Malartic West property was assembled in 2015 from the purchase of Knick Exploration's Malartic West property and some adjacent claim groups. This Property was subject to a joint venture with SOQUEM in 2018/19. From late 2019 onwards Renforth staked claims to cover the Victoria and Lalonde occurrences which were unstaked at the time. This grew into the Surimeau Property which was later merged with the Malartic West property. In 2021 several new blocks of claims were acquired in the south and northwest. No comprehensive exploration has ever taken place across the Property as a whole; historic work has been highly focused on small areas of the current Property.

5.2 Discussion of Work

The first work on the Property is in the Malartic West area where exploration appears to have begun in the late 1930s spurred by the development of gold deposits along the Cadillac Break.

Zinc and nickel mineralization was discovered in two areas in 1943 during the construction of the Rapide-Sept powerline.

The "Victoria" Zn-Ni prospect was discovered in this way, and up until the 1980s a number of property holders delineated Zn-bearing felsics and Ni-bearing ultramafics along 5 km of strike. The "Lalonde" Zn-Ni prospect was discovered similarly but received less attention from explorers after the 1950s. Possible westward strike extensions of Victoria were drilled by Canadian Nickel Co in 1965. Historic trenches at Victoria were reopened and resampled by LAC Minerals in the 1990s and by local prospectors around 2000.

The most detailed work in the "centre block" was completed by Mines de Metaux Abitibi who undertook two gold-focused drill programs in the centre of the property in the 1980s, discovering modest gold elevations in a granodiorite body and adjacent veining. This centre part of the property was held and briefly explored by Osisko (although records are not available to Minroc) and was also partly covered by SOQUEM's Malartic West Joint Venture with Renforth in 2017-19.

LAC Minerals undertook detailed surface mapping and sampling in two areas in the east of the Property in the 1980s, which in this report are named "Colonie" and "Laurin".

Work in the Huston area is poorly documented but included two reconnaissance drill programs in the 1980s which revealed a complex sequence of ultramafic through to felsic intrusives which returned modest Au assays. Significant quartz masses with a high degree of purity were noted and it was suggested in one summary report that this could have some industrial minerals application.

Several reconnaissance work programs were completed in the northeast of the Property in what was formerly the Malartic West Property, most recently by Knick Exploration in

2011. A gold showing was discovered during a Knick surface sampling program but to date this has not been successfully duplicated by Renforth.

The Beaupré copper vein area was clearly explored in the past based on the presence of obvious blast pits, but there are no records of any work there prior to its rediscovery by SOQUEM during the joint venture in 2018.

The south-centre area of the Property has apparently never seen any exploration work, except for regional scale government geologic and geophysical surveys.

Some historic work tabulated below took place partly beyond the property but is sufficiently relevant to the mineralization on the property that it is included here.

The work listed above has been compiled by Minroc with particular attention to drillhole data. This has been cross-checked where possible and built into one single GIS dataset. Drillhole data has been compiled in CSV format for easy manipulation in other software. Given the difficulty in directly verifying drillhole data passing back as far as the 1940s, this data should be seen as an exploration guide only.

6.0 GEOLOGICAL SETTING

6.1 Regional Geology

The Surimeau property is situated atop the Pontiac subprovince, close to its northern contact with the Abitibi subprovince which is demarcated by a regional-scale tectonic structure known as the Larder Lake – Cadillac Deformation Zone (or “Cadillac Break”).

The Pontiac Subprovince fills the triangle between the Cadillac Break, the onlapping mid-Proterozoic Huronian sediments to the west, and the front of the later Proterozoic Grenville Province to the east. It consists of late Archean age clastic sediments (the Pontiac Group) with minor amounts of coarser clastic (conglomerate) and chemical (iron formation) sediments.

These are isoclinally folded along axes approximately parallel to the Cadillac Break. East-west belts of volcanic and intrusive bodies pepper the northern part of the Subprovince, typically at greenschist metamorphic grade. Post-dating these units are a series of granitoidal intrusives, the dominant rock type in the area south of the property.

Metamorphic grade gradually increases deeper into the Pontiac from the Cadillac Break. In the north of the Property, primary bedding features within the Pontiac Group greywackes are readily visible. Progressively southwards these features are increasingly overprinted with pervasive alteration to biotite and staurolite.

The Cadillac Break runs from Matachewan in Ontario to east of Val-d’Or in Québec and exhibits a strong structural control on the emplacement of several suites of late Archean felsic and alkali intrusives. Numerous highly prolific gold deposits lie in close association with the Larder-Cadillac Break, including (from west to east) Young-Davidson in Matachewan; the Kirkland Lake gold camp; Kerr-Addison and other deposits at Larder Lake; the Cadillac and Malartic camps, and Sigma-Lamaque and other deposits in the Val-d’Or area. The Cadillac Break has been and remains a highly productive district for both base and precious metal mining. It remains controversial whether gold mineralization is genetically related to the various intrusives emplaced along the Break, or whether mineralization is structurally controlled.

Notably, the Canadian Malartic deposits at Malartic are hosted within the Pontiac Group as well as within the Larder Lake – Cadillac deformation zone.

6.2 Property Geology

The majority of the property is underlain by Pontiac Group sedimentary sequences consisting of greywackes with minor graphitic beds, iron formations and gritstones/microconglomerates. Primary structures such as bedding are easily visible in the north of the Property e. g. in the Beaupré Vein area, while the Pontiac units in the southern half of the Property are regionally metamorphosed to amphibolite grade and exhibit mica-staurolite schist texture. The greenschist/amphibolite front appears to run broadly east-west somewhere to the south of the Lac Surimau batholith.

Two bands of about 500 m thickness run sinusoidally east-west across the southern half of the Property, containing mixed mafic to felsic volcanics with attendant graphite and iron formation lenses, and subparallel bodies of ultramafics, and diabase/gabbro to diorite. These bands contain most of the known polymetallic mineralization. Silica-

dolomite (listwanite) alteration is strong in the ultramafic units close to their contacts. Pyroxenite and peridotite phases are mentioned in historic drill core from Victoria. Some of the ultramafic bodies may in fact be komatiite flows similar to those noted closer to Rouyn-Noranda (Rehm 2020). Minor quartz porphyry dykes and sills are also reported in historic drillholes. These two bands may form opposing limbs of a fold which would have its nose just beyond the eastern Property boundary.

Several granodiorite stocks lie within the Property, including the Lac Surimau granodiorite, the Lac Héva layered complex, a smaller stock at Lac Dupuis and likely other bodies which may be visible in geophysics but are not known in outcrop. Diorite to granodiorite sills strike northeasterly through the northern part of the Property and are strike continuations of sills that lie in the area of the Canadian Malartic mine. The southern margin of the Property overlaps with the regional scale Decelles TTG batholith.

A number of late northeast-trending faults have been interpreted from geophysical data in several parts of the Property. The Beaupré Vein may be controlled by structures dating from this same tectonic event. A number of Proterozoic diabase dykes, probably of the Biscotasing swarm, pass through the Property with a similar attitude and their emplacement may have been controlled by this same tectonic fabric.

The northeastern edge of the Property lies about 500 m from the Cadillac Break.

7.0 DEPOSIT TYPES

7.1 Outokumpu Style Polymetallic

Renforth is using an “Outokumpu” deposit model to guide exploration in the Victoria area of Surimeau. The Outokumpu deposits in Finland contain copper, zinc, gold and silver mineralization, alongside economic quantities of nickel and cobalt. The Outokumpu district supported mining continuously from several mines between 1914 and 1989, with the Kylylahti mine also operating more recently. The deposits consist of lenses of massive sulphide (mixed pyrite, pyrrhotite, sphalerite and chalcopyrite) hosted by serpentinized peridotite in close contact with a metasedimentary sequence of mica schists and quartzites, with skarn type alteration in contact zones and a highly complex later history of faulting and remobilization. The skarn zones often host lower grade, disseminated sulphide mineralization in addition to the massive sulphide lenses.

This combination of zinc with nickel is highly unusual, since magmatic and hydrothermal processes will almost always act to separate these two metals. This makes the Outokumpu deposits almost unique. Explaining the deposits in the Outokumpu region proved to be a challenge for many years.

Most current theories take the view that the deposits were formed in two stages, as if two separate mineral deposit types have overlapped and interacted. Firstly, hydrothermal fluids deposited a copper-zinc-gold-silver sulphide ore into a seafloor sedimentary assemblage, similar to what occurs at modern mid-ocean ridges. This is an example of the conventional "Volcanogenic Massive Sulphide (VMS)" deposit type, of which there are many examples worldwide. Following this initial deposit formation (by some studies about 40 million years later; see Peltonen at al 2007), peridotites from the

oceanic crust were thrust-faulted into contact with the sedimentary units during regional tectonic events. Peridotites commonly carry nickel within silicate minerals in the absence of adequate sulphur in their original magma. During these tectonic events, hydrothermal processes in the faulted contact areas allowed sulphide in the sediments to react with the peridotite, permitting the nickel to remobilize and recrystallize in sulphide minerals (pentlandite, pyrrhotite) and thereby adding nickel to the mix of metals carried by sulphides. Cobalt is also a significant ore metal in some of the Outokumpu deposits, and entered the deposits in the same way as the nickel.

Renforth theorizes that ultramafic units were brought into contact with a pre-existing, VMS-fertile stratigraphy, and the VMS provided sulphur to allow for the crystallization of pentlandite alongside the volcanogenic sulphides. Volcanogenic pyrite in the Pontiac sequence may have been converted to pyrrhotite, providing the sulphur necessary to precipitate pentlandite and pyrrhotite from the ultramafic melt.

7.2 Orogenic Gold

Gold mineralization on the Surimeau Property is interpreted to be at least superficially similar to the orogenic gold deposits which congregate along the Cadillac Break to the north. These deposits are common in Archean greenstone terranes of the Canadian Shield and generally consist of a system of auriferous quartz-carbonate veins, which have a strong spatial association with crustal-scale, compressional or transpressional shear zones with mixed brittle-ductile expression (or second or third order deformation zones). Further, there is commonly an association with particular lithologies, which are theorized to create favourable rheological or chemical environments for vein emplacement and/or gold precipitation. In many camps there is an affinity with porphyritic intermediate-felsic intrusives, iron formations and “Timiskaming-type” conglomerates; along the Cadillac Break a common association is with “porphyry” sills.

The shear zone is generally theorized to act as a pathway for hydrothermal fluids. These fluids are then emplaced as veins in dilated portions of ductile-deformed units, in brecciated portions of more brittle units, or in pore spaces of more porous units. Gold, which is often in solution with sulphur or arsenic in these fluids, will then be precipitated wherever the sulphur or arsenic can react with minerals in the country rock. Orogenic gold deposits can have highly complex geometries due to the intricate interplay of faults and favourable host units, continued tectonic activity on the shear zone after the emplacement of the mineralized veins, and disruption by later tectonic events.

The Abitibi subprovince is home to many world-class orogenic gold deposits including Canadian Malartic at Malartic (which is partly within the Pontiac Group), Macassa at Kirkland Lake, Ontario; Dome and Hollinger at Timmins, Ontario and Sigma-Lamaque at Val-d’Or, Québec.

7.3 Pegmatite Mo, Li, REE

Pegmatite-hosted molybdenum mineralization is also mentioned at the Lalonde occurrence and there is also a pegmatite-hosted beryllium occurrence listed on SIGEOM on the eastern property boundary to the southeast of the Colonie target. There is some potential for pegmatite-hosted lithium and REE mineralization similar to what is seen in the Decelles batholith a short distance south of the Property.

8.0 MINERALIZATION

Several mineralization styles have been discovered on the Surimeau Property. Many of these are fairly recent or thinly explored discoveries and are not well described.

8.1 Surimeau Polymetallic Sulphides

At the Victoria prospect, stringers, clots and semi massive bodies of mixed sulphide can be found along contacts between ultramafic bodies and the host sequence of graphitic mudstones and volcanics, as well as entirely within the host sequence, particularly where the host sequence is brecciated and quartz-welded. Sulphides consist of pyrrhotite, sphalerite, chalcopyrite and pentlandite with rare pyrite. Mineralization at the Lalonde occurrence appears to be superficially similar to Victoria and the Colonie and Huston targets may also represent a similar mineralization style.

8.2 Beaupré Vein-Hosted Cu-Ag

A northeast-striking deformation zone, hosted by near-massive sedimentary units, can be traced over about 160 m along a ridge crest in the north of the property. It has a southwest dip of ~55°. At its narrowest (~20 cm) it has the appearance of a weakly chloritized shear zone. In places it widens to form a ~1 m thick zone of silicification, brecciation and quartz flooding. Very coarse, irregular clots of chalcopyrite as well as tight disseminations of fine pyrite are emplaced within the vein and along the immediate margins. Samples return elevated Cu and Ag from this material. The depth and strike extensions are yet to be determined and it is not clear if parallel vein sets are present.

8.3 Gold Targets

A number of Au intervals were reported in drillholes in the centre of the Property during the 1980s Metaux Abitibi programs. These chiefly consist of narrow 1-2g/t Au over 1-2 m intervals and appear to coincide with intrusive contacts and silicified zones within the Pontiac Group. One notable area near Lac Surimau is home to several wide zones of anomalous gold e. g. 0.27 g/t Au over 41.6 m in MS-87-04 (Lacroix 1987). These occur within, or close to the margin of, the Lac Surimau granodiorite stock.

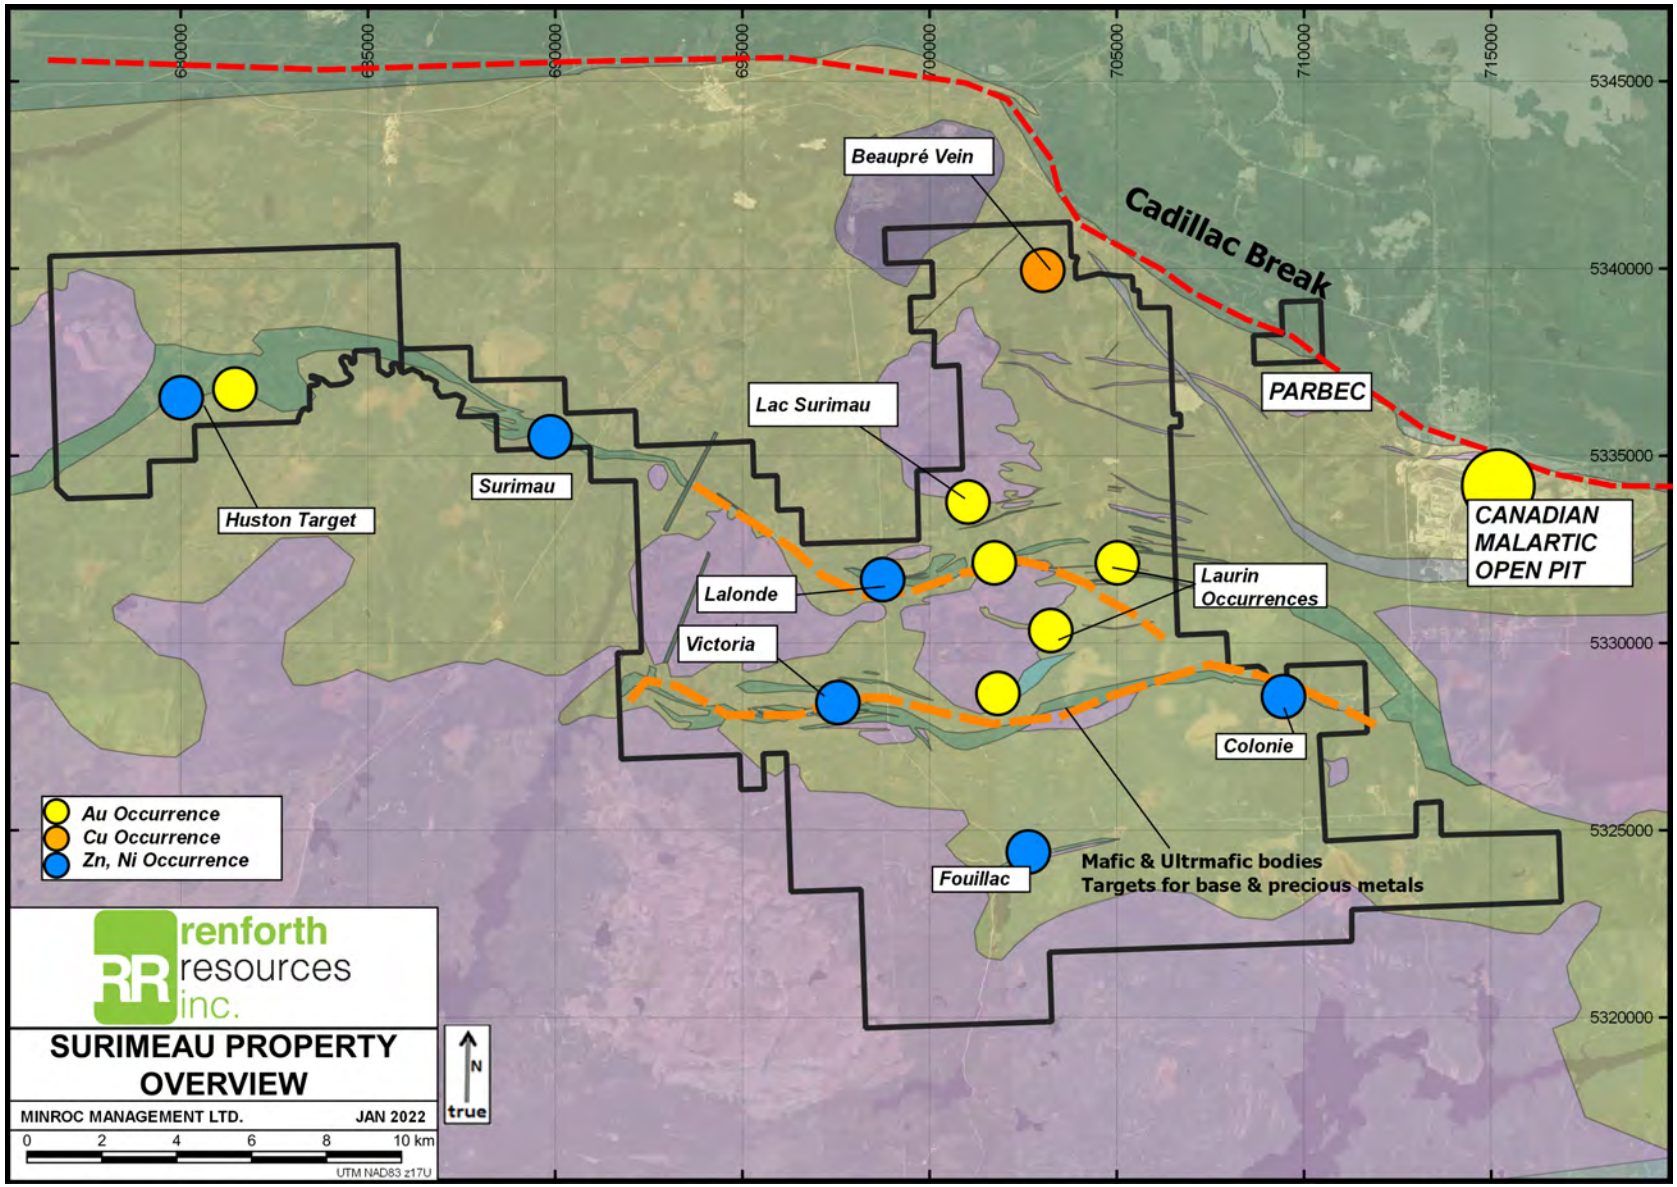

Figure 4 Property Geology

9.0 EXPLORATION

9.1 Equipment, Personnel and Logistics

Forage SMP of Val d'Or were contracted to undertake the drilling from March 24th to April 16th, 2021. Forage Roby of Val-d'Or were contracted to undertake the drilling from June 14th to July 15th, 2021, and Forage Dami-Or of Val d'Or were contracted to undertake the drilling from December 3rd to December 15th, 2021. An open area approximately 500 m west of the Rapide Sept road was used as a mobilization/staging area for all programs. Water was drawn from ponds or previously drilled drillhole casings near each of the drill holes.

Francis Newton P. Geo, OGQ acted as project geologist and undertook all drill collar spotting, core transport, supervision of drill mobilization and core logging. For the March-April program, core was logged and sampled on-site in a 10x20 ft office trailer retrofitted into a mobile core logging shack. Samples were split by Minroc personnel on-site in a modified 10x20 ft mobile container used as a core splitting shack. For the June-July and December 2021 programs, core was logged and cut in a secure site in Val d'Or, rented from Services MNG of Val d'Or. Samples were cut by Services MNG staff.

Drilling took place in three programs; the first program took place from March 24th to April 16th, 2021 (3,456 m), the second took place from June 14th to July 15th (773.2 m), 2021 and the third from December 3rd to December 13th, 2021 (1,203 m). A total of 5,432.2 m was drilled between the three programs. In total, 4,507 samples were taken, including 571 QA/QC samples. Drilling took place within claims 2546987, 2561156, 2546988, 2546989, and 2546990.

All drillholes have an azimuth of 180° to perpendicularly cut the main stratigraphy and structure identified in geophysics and by field observations, except for SUR-21-19 to SUR-21-22, which have an azimuth of 0° (or 360° North) to test the dip of the structure and to find deeper intercepts of mineralization and structure.

9.2 March-April Drillhole Descriptions

SUR-21-04 (dip-45 az180, Pad 5) – covers northern half of volcanic/ultramafic zones seen in BV-88-1 and 2.

This hole consists of sediments and graphitic mudstones/siltstones to 81.3 m, followed by wide ultramafic and basaltic rocks to at least 176.7 m. The sediments are generally weakly mineralized with only traces of pyrite and pyrrhotite, and occasional higher concentrations of py, po and rare sphalerite stringers. The graphitic mudstones/siltstones are very well mineralized with frequent 1 mm to 1.5 cm pyrite and pyrrhotite stringers and nodules. There are traces of sphalerite, pentlandite and chalcopyrite often mixed in the graphitic beds of the sediments.

The ultramafic rocks contain rare fine to medium grained disseminations and stringers of pyrite and pyrrhotite. Mineralization seemed to be stronger within the occasional bands of biotite alteration.

There are rare bands of calc-silicate in the mafic volcanics and basalts (ex: 72-74.1 m, 76-77.1 m, 78.1-81.3 m, 81.3-81.6 m) which are often very well mineralized with anywhere from 5-15% fine to coarse pyrite and pyrrhotite stringers and disseminations as well as traces of sphalerite, pentlandite and chalcopyrite.

There is a narrow QFP from 121.4-126.45 m with fine to medium grained disseminated pyrite and pyrrhotite.

The hole ends in a quartzite that is very well mineralized with pyrrhotite (15-20% overall), with fine disseminations of cpy - generally trace to locally up to 1% and local areas of up to 10% cpy, and a very bright green mineral which could be cr-diopside, as well as a significant amount of a darker green, platy mineral, likely tremolite.

This hole was stopped at 201 m.

SUR-21-05 (dip-45 az180, Pad 6) – Covers southern half of volcanic/ultramafic belt. Confirm zones seen in BV-88-1 & 2 (several multi metre intervals of 0.1% to 0.4% Ni).

This hole was collared in a narrow qfp, like the one seen in SUR-21-04, hole and mineralized with 1-3% fine to medium grained disseminated pyrite and pyrrhotite. Following the qfp is a narrow graphitic siltstone with frequent fine po and py stringers. There is a wide band of ultramafic rock from 12.45-85.3 m with rare fine to medium grained disseminations and stringers of pyrite and pyrrhotite.

There is a zone of calc-silicate alteration, resembling quartzite, from 85.3 – 96.7 m, that was well mineralized with 15-20% sulfide overall, observed as fine to coarse stringers of pyrrhotite with occasional sphalerite and pentlandite rims. This unit contains frequent bands of very strong albitization resembling chert and was more biotitized than the one in the previous hole.

Following the calc-silicate alteration zone is another relatively wide ultramafic unit from 96.7-120.75 m which was more strongly biotitized and has patches of weak pervasive carbonate alteration. There is stronger mineralization in this unit with frequent coarse clotty po, pentlandite and sphalerite in carbonate veinlets from 96.7-97.2 m, fine po

along the margins of faint and wispy carbonate veinlets 96.7-103.7 m and trace pyrrhotite 103.7-120.75 m.

The hole reaches some type of sediment at 120.75 m which a narrow quartzite-type band from 120.75-121.8 m with 5-10% med to coarse stringers and clots of pyrrhotite along bedding. The calc-silicate alteration gradually disappears and the rock grades into greywacke sediments which last to the end of the hole.

This hole was stopped at 207 m.

SUR-21-06 (dip-45 az180, Pad 4) – Covers southern half of volcanic/ultramafic belt. Locate extension of zone seen in P152 (1.28% Zn over 11.43 m; about 70 m east) and site of 2020 Minroc grab samples (up to 2.42% Zn)

The top of this hole consists of a greywacke with a quartz-biotite-muscovite matrix to 77.75 m. Bedding is quite steep at approximately 80 deg to the core axis, indicating a north-dip. There is a very well mineralized quartzite following the greywacke with 15-20% pyrite overall with occasional pyrrhotite stringers and clots and trace clotty chalcopyrite. A graphitic siltstone is present to 95.2 m with frequent stringers and nodules of py+po, with frequent rims of sphalerite and pentlandite around the large py+po clots. The graphitic siltstone in this hole contains noticeably more pyrite than in the first hole.

There is another quartzite 99.3-100.45 m with coarse sphalerite and pyrrhotite stringers, trace pentlandite and chalcopyrite and trace pyrite. This unit takes on a greenish-grey-brown colour with a very gradual lower contact into the underlying ultramafics. This may be another calc-silicate alteration zone, a rock that resembles quartzite and is formed when ultramafic rocks are carbonated. This unit appears again 133.15-140.75 m.

There is a narrow QFP from 128.75-132.05 m, like the one observed in the first hole. Followed by another calc-silicate zone (without the green platy actinolite or any traces of Cr) with 10% py+po stringers and approximately 15% sphalerite stringers.

The hole reaches ultramafics at 146 m. The hole was stopped at 204 m.

SUR-21-07 (dip-45 az180, Pad 3) – Covers southern half of volcanic/ultramafic belt. Locate extension of zone seen in P152 (1.28% Zn over 11.43 m; about 70 m east) and site of 2020 Minroc grab samples (up to 2.42% Zn)

This hole is collared in ultramafics which last until 64.35 m, where there is a well mineralized bed of graphitic siltstone.

There is a calc-silicate alteration zone from 65.4-68.35 m. It is very hard and has a dark creamy-brownish-green colour due to the presence of a green mineral, possibly actinolite. It is very well mineralized with 10-15% sulfide overall, primarily pyrrhotite, with fine to medium grained clots of sphalerite and traces of pentlandite. Immediately after this unit is a brownish-grey ultramafic, strongly biotitized and contains green cr-diopside / garnet from 70-71.4 m. This unit is also very well mineralized with clotty po and po stringers throughout with traces of sphalerite.

Mudstone / graphitic siltstone is present from 85-87.95 m with 10-15% fine to med disseminated pyrrhotite and coarse clots (1-4 cm) which are heavily fractured.

Throughout this unit are fine to coarse specs of cpy (1-2% overall) and coarse sphalerite, often alongside or within po clots/stringers.

Another ultramafic is present (87.95-110.6 m) with at least trace po through most of the unit. A band of sphalerite is present (10-15% sphalerite) from 88.7-88.75 m. There is a narrow band of graphitic mudstone from 90-90.7 m 10-15% po. Another graphitic mudstone is present 110.6-114.65 m with fine to med disseminated and clotty po, cpy and traces of sphalerite.

Yet another zone of calc-silicate alteration is present from 126.05 – 129.6 m with 10-15% pyrrhotite throughout, observed are fine to coarse stringers. Sphalerite was often present alongside or within po stringers. Following this is a wide graphitic siltstone, very well mineralized with 10-15% sulfide content, primarily pyrrhotite and pyrite with trace sphalerite, pentlandite and chalcopyrite.

There is another wide ultramafic unit 133.1-146 m with patches of very strong biotitization and occasional fine-grained beds of sediments. Also present is a narrow “calc-silicate” zone from 142.15-143.8 m. Graphitic siltstone is present again near the end of hole, 146-158.6 m, with 5-10% po stringers and sedimentary nodules throughout. There are traces of cpy, sphalerite and pentlandite as well.

The hole is stopped in coarse grained ms-bt-qz rich sediments with occasional, narrow qz veinlets, generally concordant to bedding. Most of the veinlets contain trace clotty pyrite and pyrrhotite.

This hole was stopped at 201 m.

SUR-21-08 (dip-45 az180, Pad 8) – Covers the northern half of the volcanic/ultramafic belt. Test horizon seen in DDH V-01, 02 & 03 (no assays, but multi sulphide mineralization present)

Most of the hole consists of sediments, with ultramafics starting at 65.25 m. The sediments to 37.1 m are coarse grained with a quartz-biotite-muscovite assemblage. Mineralization is rare with only traces of py, po and very rare cpy in qz stringers and veinlets. The sediments from 37.1-52.5 m are fine to medium grained and at least weakly silicified with frequent bands of strong to very strong silicification. The top of this unit (37.1-39.4 m) is very heavily fractured and silicified, with numerous sulfide stringers and clots within the fractures. Pyrite and pyrrhotite stringers are present frequently throughout the rest of the unit.

The sediments from 52.5 – 65.25 m are primarily greywacke with frequent patches of graphite and narrower beds of graphitic siltstone. There is also a calc-silicate alteration zone from 52.8-54.3 m with up to 10% po and 10% sph throughout it. The graphitic siltstones were also very well mineralized with frequent bands of 10-15% sulfide, mainly pyrrhotite and sphalerite, with occasional fine stringers of chalcopyrite. There are two very well mineralized bits in this unit; 58.15-58.35 m in a bed of graphitic siltstone is approximately 40% sulfide overall with fine to med stringers of cpy, fine to med clots of sphalerite and coarse po stringers. The second band of stronger mineralization is from 61.47-62 m with approximately 40% sulfide as well – mainly coarse clots and stringers of sphalerite, some pyrrhotite and fine to med stringers of cpy.

The hole reaches ultramafics at 65.25 m, which continue to 194 m. From 171.1-175.3 m are spinifex textures in possible komatiites with biotite and carbonate vein breccias above and below the komatiites, possibly showing a section through and entire flow. Trace pyrrhotite is present from 174.8-194 m. There is a narrow band of QFP from 186.55-187.2 m with biotitized contacts.

Graphitic mudstones/siltstones are present from 194-201.1 m with silicification throughout and biotite around margins. Chalcopyrite, pentlandite and sphalerite are seen within and around coarse pyrrhotite grains. Ultramafics are seen again from 194-222 m with diopside and biotite alteration. Trace up to 2% disseminated pyrrhotite is seen throughout.

This hole was stopped at 222 m.

SUR-21-09 (dip-45 az180, Pad 7) – Covers the southern half of the volcanic/ultramafic belt. Passes ~50m W of historic Trench 24/25 area with significant mineralization (historic channels reported to inc. 3.5% Zn, 0.17% Ni and 0.02 oz/ton Au over 1.22 m); and 2020 Minroc grabs up to 3.16% Zn

The hole is collared in ultramafics with calcite biotite veins typical for pillow lava flows up to 11.4 m. From 11.4 to 59.35 m are grey to bluish grey ultramafics with some traces of spinifex textures and pyroxene xenocrysts. Graphitic siltstones with sharp contact margins are present from 59.35-72.2 m. The graphitic siltstones are strongly silicified around the contacts. The contacts themselves are marked by strong biotite and phlogopite. Sulphides include pyrrhotite, pentlandite, sphalerite and chalcopyrite.

From 72.2 -120.6 m are similar ultramafics but contain 1-2 % disseminated pyrrhotite. From 120.6-129.9 m is a zone of mixed ultramafics and aphanitic siliceous sediments. Pervasive biotite is seen throughout this unit.

Silicified sediments contain up to 3 % pyrrhotite and sphalerite. From 124.9 to 137.5 m are medium grained sediments with cordierites and relict garnets. Narrow bands of silica rich veins are present from 134.1-134.4 m and 135.55-135.65 m. These bands are not graphitic but contain 5-10 % pyrrhotite and 1-3 % sphalerite. Occasional bands of QFP with trace pyrrhotite are present from 195.3-200.9 m.

This hole was stopped at 207 m.

SUR-21-10 (dip-45 az180, Pad 9) - Covers southern half of volcanic/ultramafic belt and duplicate mineralization seen in S-1 and S-5, ~50 m to the west (inc. possible intervals of 0.24% Ni over 9.3 m, poorly documented).

This hole is collared in ultramafics with frequent brecciation, perhaps indicating low viscosity flows, from 3.3-151.4 m, as well as occasional narrow QFP's. Following the ultramafics are greywacke sediments to 201 m. Overall, this hole had no graphitic mudstones up to at least 122.85 m.

From 121.45-122.85 m and 146.2-141.1 m is an ultramafic that has been replaced by strong silicification. Trace to 3-10 % pyrrhotite and sphalerite is present within this interval. Partly recrystallized and unmineralized, beige to dark blue QFP's are present from 120.7-121 m.

From 151.4 to the end of the hole at 201 m are fine grained quartz -biotite sediments and metasediments with cordierite porphyroblasts. Marcasite filling was observed in concordant fractures from 163.7 to 161.2 m.

This hole was stopped at 201m.

SUR-21-11 (dip-45 az180, Pad 10) - Covers southern half of volcanic/ultramafic belt in poorly explored area.

The hole is collared in ultramafics, which are present to 81.8 m. The ultramafics are brecciated up to 11.7 m and predominantly cumulate thereafter. From 21-24 m is a zone with strong silicification within the ultramafics and vuggy calcite around 21-21.2 m and 23.8-24 m. This zone contains 3-7 % sphalerite and up to 15 % pyrrhotite.

From 24-40.4 m is a zone of unmineralized, dark blue quartzo-felspathic porphyry within the ultramafics. Multiple intervals of breccia are seen from 40.4-54 m. From 54-81.55 m are xenocrysts composed of pyroxene and magnetite are seen in the ultramafics. Overall, the ultramafics have trace pyrrhotite. However, 72.7-79.5 m there is a marked increase in disseminated pyrrhotite up to 2%. From 81.55-81.8 m is a narrow band of graphitic mudstone with sharp contacts and up to 10 % sphalerite and pyrrhotite.

The Pontiac sediments are intersected from 81.8-163.3 m with biotite and a weak tremolite overprint. Al-silicate porphyroblasts, like cordierite and garnets, are seen throughout. A narrow band of graphitic mudstone with a quartz breccia with 5% pyrrhotite and some sphalerite is present from 94.95-95.15 m. A wide zone of dark blue QFP is seen from 163.3- 200.1 m with labradorite and patches of trace up to 1% pyrrhotite.

This hole was stopped at 216 m.

SUR-21-12 (dip-45 az180, Pad 11) - Covers southern half of volcanic/ultramafic belt. Undercut SUR-20-002 and review mineralization in that hole (0.13% Ni over 20.5 m)

This hole was collared in massive ultramafics showing effects of weathering. The ultramafics are generally massive with strong biotitization and tremolite replacement where foliation is stronger. Overall, the ultramafics have trace to 1% fine to medium grained disseminated pyrrhotite. A gradual silicified contact was observed between the ultramafics and the graphitic sediments.

The graphitic sediments are present from 15-54.6 m. Sulfides include pyrrhotite, sphalerite and chalcopyrite. Sulphide content is 8-15% from 32 -50.4 m. The main graphitic and pyrite bearing layers are seen from 32.8 to 38.5 m, and from 43.2 to 45.4 m. The core is overall blocky in this zone.

From 54.6-69.6 m is a dark green ultramafic with precursor serpentinization. This unit has a mixed upper contact with hanging wall sediments over 0.5 m, and a strongly altered lower contact from 65 to 69.6 m. This unit hosts 1-2% fine disseminated pyrrhotite.

From 69.6-155 m are sediments with occasional QFPs and quartz-calcite veins. Trace pyrrhotite and pyrite is seen intermittently. Green to brownish, fine granoblastic texture

marked by 10% 2-5 mm micaceous cordierite porphyroblasts concentrated in cm-scale layers are present down to 88 m, the frequency of which decreases with depth.

This hole was stopped at 201 m.

SUR-21-13 (dip-45 az180, Pad 14) - Covers northern half of volcanic/ultramafic belt

This hole is collared in sediments, which continue to 65.6 m when the hole reaches ultramafics, present to the end of the hole at 201 m.

The sediments have a quartz-biotite-garnet assemblage with a relatively consistent foliation at 60-70 degrees to the core axis. From 4.3-36.5 m are frequent 0.5-10 cm quartz and pegmatitic muscovite veins. These veins decrease in frequency to 49 m. Mineralization in the sediments to 49 m is weak overall, trace to 1% fine po is present 21.1-23 m and 1-2% fine py is present 47.35-49 m. From 49-65.6 m are frequent meter-scale beds of graphitic mudstone which are very well mineralized. Mineralization in these graphitic beds range from 3-15% pyrrhotite in fine to coarse stringers and medium to coarse grained sedimentary nodules.

The ultramafics are fine grained overall and consist of massive to finely granular cumulate komatiite flows occasional flow-top breccias. There are occasional bands of spinifex. Biotite-Carbonate-Chlorite alteration is strongest in the breccias. There are frequent pinkish-purple QFP veins from 144.25-196.5 m ranging from less than a meter to approximately 6 m thick. Mineralization overall is weak with occasional disseminations of trace to 1% pyrrhotite (ex: 65.6-69.6 m) and a single fracture of molybdenite at 103.2 m.

This hole was stopped at 201 m.

SUR-21-14 (dip-45 az180, Pad 13) – Covers northern half of volcanic/ultramafic belt in poorly explored area

This hole is similar to SUR-21-13, although there are no graphitic mudstone beds and no QFP's were found in the ultramafics. This hole was collared in sediments, the same as in SUR-21-13 with a quartz-biotite-garnet assemblage. Bedding here is consistently around 60 degrees to the core axis. Mineralization is concentrated in bands of plagioclase-tremolite replacement/alteration from 25-32.5 m and within bands of moderate to very strong biotite alteration 28-42.8 m. Mineralization ranges from trace pyrrhotite to 5-10% sulfide stringers (25.7-27.6 m, 33.15-33.7 m, 38.45-39.4 m) where there are fine sphalerite stringers alongside the pyrrhotite. The hole reaches ultramafics at 42.8 m. These are nearly identical to what was observed in hole 13 but no QFP's are present. There are occasional disseminations of trace to 1% fine pyrrhotite.

This hole was stopped at 201 m.

SUR-21-15 (dip-45 az180, Pad12) – Covers northern half volcanic/ultramafic belt, undercut SUR-20-003 and confirm mineralization seen at surface (0.48% Ni over 1 m, unconstrained)

This hole is nearly identical to SUR-21-14 to 189.1 m. This hole was collared in sediments with a quartz-biotite-garnet assemblage. Bedding here is consistently around 75 degrees to the core axis. Mineralization is strongest 46.75-52 m where trace to 1%

pyrrhotite was observed with occasional coarser clots of po and sphalerite. Fine traces of chalcopyrite and molybdenite were also observed. The hole reaches ultramafics at 52.6 m. These are identical to what was described in SUR-21-13 and SUR-21-14. There are occasional disseminations of trace to 1% fine pyrrhotite.

There are sediments from 176.1-189.1 m which are dark grey to black in colour, fine to medium grained and is generally at least weakly graphite bearing. The unit has a Feldspar-mica assemblage with more minor quartz, mostly visible in sandstone and occasional 1-3 cm chert beds. The two main graphitic mudstone layers are from 181.35-182.3 m and 187.55-187.7 m. Mineralization varies quite a bit in this unit:

- 177 – 177.65 m: 5-10% pyrrhotite (fine stringers) surrounded by irregular quartz breccia, millimeter-scale sphalerite grains in quartz and alongside po.
- 181.35 – 182.25 m: 5% Po, 2-3% Sph, trace to 1% Cpy in graphitic mudstone. Sulfides observed as stringers and fracture fills ranging from 1-5 mm thick.
- 182.25 – 186.4 m: 3-5% sulfide overall, primarily Po with rare retrograde pyrite, traces of sph and cpy. Occasionally disseminated but mainly observed as 1-5 mm stringers and fracture fills.
- 187.1 – 187.7 m: 5% Po, 2-3% Sph and trace to 1% Cpy in graphitic mudstone and in fine grained siltstone, observed in 1-5 mm stringers and fracture fills.
- 188.05 – 188.1 m: 5% Po and 1-3% Cpy in 1-3 mm thick stringers and fractures.

Ultramafics are present from 189.1 m. This hole was stopped at 201 m.

SUR-21-16 (dip-45 az180, Pad 15) - Undercut VIC-90-2 & 3 (moderate Zn mineralization, no Ni assays)

This hole was collared in sediments with a quartz-biotite-garnet assemblage. Bedding here is consistently around 70-80 degrees to the core axis. The first band of ultramafics is 22.9-114.9 m. Patches of disseminated pyrrhotite, traces of pentlandite and rare chalcopyrite are present from 90 to 100 m. There are two bands of sediments from 114.9-126.15 m and 130.85-133.85 m, both with graphitic mudstone beds and ultramafics in between. These sediments are dark grey to black in colour, fine to medium grained and generally at least weakly graphite bearing with a few meter-scale graphite mudstone beds within them. The units have a feldspar-mica assemblage with minor quartz, mostly visible in sandstone. The main graphitic mudstone layers are from 119.7-120 m, 120.8-121.6 m, 122.55-124.85 m, 131.05-131.5 m and 132.05-133.45 m. Mineralization is present through most of the sediments here but it strongest in the graphitic mudstones, observed as nodules, clots and stringers of py, po, pent, sph and cpy.

Another band of ultramafics is present 133.85-153.45 m with trace to locally up to 2% pyrrhotite throughout most of the unit. As before, the ultramafics are grey to green in colour, fine grained and are massive overall. Alteration varies but generally consists of Fe-tremolite-biotite with occasional wispy calcite veining or pervasiveness.

The hole reaches sediments again at 153.45 m, which last until the end of the hole at 284 m. Biotite alteration is present through most of the core with occasional bands of

carbonate and tremolite alteration. The sediments have a dark blue-grey colour from 170-177 m with coarse clotty muscovite throughout and no visible biotitization. There are occasional clusters of a 1-10 mm blue-grey al-silicate minerals, often elongated along foliation/bedding from 161.2-170 m and 179-209.7 m.

This hole was stopped at 284 m.

SUR-21-17 (dip-45 az180, Pad 11) - Test strike continuation ~200 m east of historic trenching and drilling. Confirm historic channels from Trench 2 (reported to inc. 1.3% Zn, 0.13% Ni and 0.12 oz/ton Au over 1.22 m).

This hole was collared in sediments with a quartz-biotite-garnet assemblage. Bedding here is consistently around 60 degrees to the core axis. Meter-scale albitized-silicified bands appear within the sediments 27-58.7 m. These bands are strongly biotitized and contain approximately 30% qz-ab phenos. A narrow band of 1-5 cm graphitic mudstone beds is present 57.6-58.25 m, well mineralized with 1-2% pyrite and trace to 1% sphalerite, observed as fine stringers and crystals.

The first band of ultramafics are present 58.7-109.6 m. The ultramafics, as before, are grey to green in colour, fine grained and are massive overall. Alteration varies but generally consists of Fe-tremolite-biotite with occasional wispy calcite veining or pervasiveness. There is extremely strong Biotitization and foliation 76.4-91.15 m, followed closely by calc-silicate altered ultramafics from 106.25-109.6 m. This unit resembles quartzite but is green to brown in colour, fine to medium grained with a plagioclase matrix containing bands of Cr-diopside – Cr-tremolite and occasional bright green Cr-grossular garnets. This is the same unit observed in our western holes (SUR-21-04, 05, 06, 07). This unit is very well mineralized with 5-10% sulfide overall, primarily pyrrhotite and sphalerite with traces of pentlandite and chalcopyrite.

Immediately following the ultramafics is a wide band of sediments. There is a graphitic mudstone 109.6-111.25 m that contains 5-10% Po with trace sphalerite and chalcopyrite, observed as fine stringers and nodules. The sediments continue to at least 242.35 m, occasionally mineralized with 1-2% pyrrhotite+pyrite stringers and clots.

There is a granitoid unit following sediments, from 242.35 to at least 291.8 m. This unit is coarse grained with a qz – k-felspar – bt assemblage and rare patches of trace to 1% fine pyrite. The hole ends in fine grained greywacke sediments containing frequent qfp veins.

This hole was stopped at 300 m.

SUR-21-18 (dip-50 az180) – Located on the same section as SUR-21-06 and 07, meant to cover the width of strong mineralization seen visually. Approximately 50 m south of SUR-21-06.

This hole is an overcut of SUR-21-06 and an undercut of SUR-21-07, drilling approximately 50 m south of hole 6.

This hole was collared in sediments with a quartz-biotite-garnet assemblage. Bedding here is consistently around 80 degrees to the core axis. The rock becomes graphitic from 27.5 m to the graphitic mudstone contact at 30.15 m. Mineralization appears when

the sediments become graphitic in the form of frequent 1-2 mm pyrite and pyrrhotite stringers.

The graphitic mudstone is present in the hole from 27.5 m to at least 50.9 m. It is fine to medium grained with bedding at approximately 70 deg to the core axis. There are occasional wide bands of qz-ab stringers which may possibly represent fine micro-brecciation within the mudstone. There are also fine square brownish-grey clasts or fragments 42-44 m which might be part of the breccia. This unit is very well mineralized with frequent 0.5-3 cm stringers and 1-5 cm nodules of primarily pyrite-pyrrhotite. These stringers and nodules often also contain sphalerite and pentlandite with traces of chalcopyrite. The nodules are often rimmed with pyrite around pyrrhotite cores.

Following the graphitic mudstone is a narrow bed of sediments, followed by a quartzite and calc-silicate alteration zone in the contact area between the sediments and ultramafics, from 55.25-56.75 m. This zone is well mineralized with 3-5% sulfide overall, primarily pyrrhotite stringers with traces of sphalerite, pentlandite and chalcopyrite.

The first band of ultramafics is present 56.75-82.05 m with traces of pyrrhotite throughout, followed by a weakly mineralized qfp and another zone of calc-silicate alteration and sediments, from 85.95-95.3 m. This interval is very well mineralized, 5-15% sulfide overall, with pyrrhotite, pentlandite and traces of sphalerite and chalcopyrite. Highlights below:

More ultramafics follow the above interval, to 152.3 m, with traces of pyrrhotite throughout it. This may be a combination of Ni in silicates and fine amounts of pentlandite with the disseminated pyrrhotite through the unit. Another narrow graphitic mudstone is present within the ultramafics from 152.3-155.6 m.

Ultramafics continue to 283.65 m, followed by a narrow zone of calc-silicate alteration to 292.95 m. This style of alteration seems to occur when the sediments are in contact with the ultramafics. It may be the result of contact metamorphism when the hot ultramafics came into the system. Mineralization in this unit consists of frequent pyrite and pyrrhotite stringers with traces of sphalerite, pentlandite and chalcopyrite.

Sediments appear at 292.95 m and last to the end of the hole at 411 m. These are occasional bands of albitization, and more frequent QFP veins near the bottom of the hole, from 399.1-411 m. Mineralization is generally at least trace pyrite, with local concentrations up to 1-3% py+po, mainly around and within narrow qz-ab veinlets. There is a fine fracture at 294.5 m with coarse cpy, sph and trace pentlandite.

This hole was stopped at 411 m.

9.3 June-July Drillhole Descriptions

SUR-21-19 (dip-60 az0) – Drilled from SUR-21-12 collar due north for a deeper intercept of structure/mineralization.

Ultramafics are present through the entire hole. Relatively strong mineralization is present from 175.5-178.65 m with 5-10% fine to medium grained disseminated pyrite and pyrrhotite. The best (visual) zone is from 176-176.7 m where there are fine clotty chalcopyrite stringers (5%), semi-massive py+po (15-20%) and trace sphalerite. This is

the deepest mineralized zone observed on Surimeau to date with an approximate vertical depth of about 150 m.

This hole was stopped at 237.7 m.

SUR-21-20 (dip-60 az0) – Drilled from SUR-21-07 collar due north for a deeper intercept of structure/mineralization.

This hole consists of primarily of ultramafics with occasional bands of graphitic mudstone and a QFP. The widest graphitic mudstones are 123.8-128.3 m and 173.3-180.35 m. There are occasional narrower beds of graphitic mudstone, although it is occasionally a mix of ultramafics and graphitic mudstone (ex: 163.6-169.05 m).

Mineralization is consistent at trace to around 1% fine to med disseminated pyrrhotite and pyrite to 118.3 m where mineralization starts to get stronger, up to 3% fine to med disseminated po and py. At 37-37.1 m is a small, irregular quartz-carbonate veinlet with coarse clotty (semi-massive?) pentlandite and coarse clotty chalcopyrite. The vein seems to come from a narrow down-hole oriented graphite-filled fracture or seam. Deeper in the hole at 79.3-80.3 m is a fracture or stringer with 1-2% fine to medium grained molybdenite along it. The first graphitic mudstone from 123.8-128.3 m is very well mineralized with 5-7% sulfide overall (stringers, clots and nodules) consisting of Po+Py and Sphalerite with traces of chalcopyrite and pentlandite.

The amount of mineralization remained relatively elevated from this point on in the hole. The calc-silicate zones in the ultramafics consistently carry 1-5% sulfide (Po+py, tr cpy) and the graphitic mudstones carry 5-10% sulfide overall.

The QFP from 197.45-205.7 m is massive, blue-grey in colour with fine to medium grained biotite and trace pyrite throughout.

The ultramafics from 205.7 m to the end of the hole at 212.45 m is weakly mineralized with trace fine to med grained pyrrhotite.

This hole was stopped at 212.25 m.

SUR-21-21 (dip-60 az0) – Drilled north, located 150 m due south of SUR-21-17 for deep intercept of shear zone.

This hole consists of ultramafics throughout. Mineralization was sparse with occasional fine clots of pyrrhotite but appeared to be barren overall. Alteration varied with weak biotitization and amphibolization throughout with occasional patches of stronger alteration.

This hole was stopped at 184.75 m.

SUR-21-22 (dip-60 az0) – Drilled from SUR-21-07 collar due north for a deeper intercept of structure/mineralization.

This hole consists of dark grey muscovite-biotite bearing, fine to medium grained metasediments throughout. Mineralization was sparse with occasional traces of pyrite along fracture planes. Alteration varied with weak to mod Biotitization and muscovite alteration throughout with occasional patches of stronger alteration, generally in areas of stronger schistosity and blockiness.

This hole was stopped at 139 m.

9.5 December Drillhole Descriptions

SUR-21-23 – Drilled near the east end of the trenching where there is well mineralized bedrock (Strong Cpy, Py, Sph) in graphitic mudstone, ultramafics and the main shear.

This hole consists of ultramafics as before, to 122.65 m, grey to green in colour, medium grained and are massive overall with occasional darker green volcanic breccias and/or komatiites / flows. Alteration varies but generally consists of Fe-tremolite-biotite with occasional wispy calcite veining or pervasiveness and occasional zones of extremely strong Biotitization and foliation. There are three 4 bands of calc-silicate altered ultramafics from (28-29.2 m, 44.8-45.9 m, 59.75-61.5 m and 74.7-75.4 m). At the beginning of the March-April program was a unit initially identified as “listwanite”, but it is now viewed as an alteration within the ultramafics. This unit resembles quartzite but is green to brown in colour, fine to medium grained with a plagioclase matrix containing bands of Cr-diopside – Cr-tremolite and occasional bright green Cr-grossular garnets. This unit is very well mineralized, generally around 10-15% sulfide overall.

The mineralized zone from 44.8-45.9 m is semi-massive sulfide with 25-30% sulfide overall, and consist of pyrite, pyrrhotite, sphalerite, pentlandite and chalcopyrite.

The ultramafics continue to a depth of 122.65 m, followed by a narrow zone of fine-grained sediments and beds of graphitic mudstone. Mineralization in the graphic mudstone consist of 2-7% sulfide as stringers and nodules, occasionally with py-po rimmed sphalerite. From 127.5-162 m (end of hole) are quartz-biotite-muscovite meta-sediments with occasional clusters of pale blue al-silicates and rare clusters of brown staurolite crystals.

This hole was stopped at 162 m.

SUR-21-24 - Overcut of SUR-21-23 and 25. Drilled under new stripping under the well mineralized bedrock near east end of trench (strong Cpy, Sph and Po mineralization in graphitic mudstone + ultramafic).

This hole is essentially the same as SUR-21-23, but the units are shorter because of the shallower dip. Mineralization in the albitized calc-silicate bands is similar. There are more of these mineralized zones through this hole compared to the first, although they are narrower for the most part.

This hole was stopped at 117 m.

SUR-21-25 - Undercut of SUR-21-23 and 24. Drilled under new stripping under the well mineralized bedrock near east end of trench (strong Cpy, Sph and Po mineralization in graphitic mudstone + ultramafic).

This hole follows the same pattern as it’s two overcut holes (23 & 24). Ultramafics continue to 171.45 m, with biotite and tremolite alteration getting stronger with depth. There are a handful of calc-silicate – ab alteration zones, well mineralized with sulfide stringers and clots, from 78.5-107.05 m. There are also a few narrow bands of calc-silicate alteration with green cr-diopside and clotty and disseminated pyrrhotite. XRF scans indicate the presence of cpy, pentlandite and sphalerite chalcopyrite is only

visible in a few small areas, so it may be present as small grains within or around pyrrhotite.

The hole reaches sediments around 171.45 m. The “contact zone” between the ultramafics and sediments is very well mineralized with frequent bands or beds of calc-silicate alteration and/or silicified and albitized sediments. These look very similar to the zones seen in the previous holes near the boundary. This mineralization is present from 171.45-180.2 m. XRF scans show little Ni but elevated Zn and traces of Ni and Cu, indicating that these zones are likely sedimentary rather than calc-silicate altered ultramafics. From 180.2 m to the end of the hole at 189 m are frequent clots, nodules, and stringers of pyrite and pyrrhotite.

This hole was stopped at 189 m.

SUR-21-26 - Drilled under new stripping under well mineralized bedrock near west end of trench, between the two historic trenches. Strong Cpy, Py, Sph mineralization. (Dip -45).

This hole follows the same sequence as the first three holes near the east end of the trench area. The mineralized zones in the ultramafics are present in this hole, however, they are narrower. This might mean that the zones are boudinaging and not a consistent thickness.

The ultramafics continue to a depth of 121.65 m, followed by a narrow zone of fine-grained sediments and beds of graphitic mudstone from 122.6-122.9 m. Mineralization in the graphic mudstone consists of 5-7% sulfide as stringers and nodules, occasionally with py-po rimmed sphalerite. These fine-grained sediments continue to 130.5 m with occasional fine py-po-cpy stringers and clots.

From 130.5-144 m are quartz-biotite-muscovite meta-sediments with occasional clusters of pale blue al-silicates and rare clusters of brown staurolite crystals. There are two narrow beds of silica and carbonate alteration with very fine stringers of py-po-cpy.

This hole was stopped at 144 m.

SUR-21-27 - Undercut of SUR-21-26. Drilled under new stripping under well mineralized bedrock near west end of trench, between the two historic trenches. Strong Cpy, Py, Sph mineralization. (Dip -60).

This hole is essentially a mirror of SUR-21-26. Ultramafics continue to 132.8 m, however, there is a narrow band of sediments 73.5-79.8 m within the ultramafics. The upper contact of this narrow bed of sediments is well mineralized with 1-5% sulfide, (Py, Po, Sph, Cpy) stringers and disseminations, approaching the contact with the sediments. At the contact is 50 cm of albitized and/or silicified sediments, resembling the calc-silicate alteration often found in the ultramafics, with 5-7% sulfide overall (po, py, sph, pent). This is probably the same zone as the calc-silicate alteration zone.

The contact area between the ultramafics and sediments at the bottom of the hole has the same style of mineralization but it is quite a bit wider. The mineralized zones (ab-sil, sulfide bearing) are found 135-135.55 m and again from 135.8-137.6 m.

This hole was stopped at 147m.

SUR-21-28 - Undercut of SUR-21-26 and SUR-21-27. Drilled under new stripping under well mineralized bedrock near west end of trench, between the two historic trenches. Strong Cpy, Py, Sph mineralization. (Dip -60).

The ultramafics continue to a depth of 211.45 m. There are wide zones of tremolite-biotite alteration with serpentinized cracks/fractures and occasional sections of volcanic breccia. These zones are present in all the previous holes of the program and likely represent the boundary between separate flows.

There are two narrow bands of ab – calc-silicate alteration, present from 126.15 – 128.6 m. The two zones are 126.15-126.95 m and 128-128.6 m and contain 2-5% sulfide overall as stringers of py-po-sph and traces of pentlandite. There is trace to up to 1% disseminated sulfide between these two zones in calc-silicate altered ultramafics as well.

From 211.45 m to 216.4 m is a mix of ultramafics and sediments, with three narrow beds of sulfide-bearing graphitic mudstone (211.55-211.65 m, 211.8-211.9 m, 212.15-212.85 m) containing 2-3% sulfide overall as fine to coarse clots/nodules and stringers of py, po and sphalerite. Bedded quartz-biotite-muscovite sediments continue to 234 m with trace to 2% fine disseminated and stringer py+po to 226 m.

This hole was stopped at 234 m.

SUR-21-29 - Drilled under new stripping in the approximate center of the new trenching (Dip -80).

This hole is located between the pads for SUR-21-23,24,25 near the east end of the trenching and SUR-21-26,27,28 near the west end of the trenching. Ultramafics continue to a depth of 189.25 m, and there is a mix of ultramafics and sediments to 197.6 m. There is a section 43.8-90.2 m that is a very strong green colour. Most of this zone is strongly fe-tremolite-biotite altered and is fine grained and relatively hard. Near the bottom of this zone from 77.3-86.3 m are frequent pale greenish-grey-brown bands within the ultramafics, containing diopside-calcite-tremolite and rare grossular garnets. This unit was observed in the March-April program, and it was identified as either deformed pillows or cumulates.

Mineralization through most of the ultramafics in this hole consists of trace to locally up to 3% fine to medium grained disseminated pyrrhotite. There is a narrow band of albitized / calc-silicate altered ultramafics 88.65-88.85 m with 7-10% sulfide overall as stringers and disseminated sulfide.

Immediately following this band of mineralization is strong tremolite-cr-diopside-carbonate alteration with 1-3% disseminated pyrite and pyrrhotite, continuing to 90.2 m. After 90.2 m, the ultramafics return to a massive bluish colour with frequent pyroxene-magnetite xenoliths and fine to medium disseminated pyrrhotite throughout it.

From 189.25 m to 197.6 m is a mix of ultramafics and sediments, with two narrow beds of sulfide-bearing graphitic mudstone (191.8-191.85 m, 192-192.15 m) containing fine to coarse clots/nodules and stringers of py, po and sphalerite. Immediately following this are bands of ab-calc-silicate altered rock as in the previous holes, from 189.25-197.6 m, with cr-diopside-cr-tremolite and rarely grossular garnets. This zone is mineralized with

2-5% sulfide overall are stringers, clots, and disseminations. This alteration/mineralization zone is likely sedimentary in origin.

Bedded quartz-biotite-muscovite sediments continue to 210 m with trace, locally up to 3% fine disseminated and stringer py+po to 205 m.

This hole was stopped at 210 m.

9.6 Results

The ultramafic unit is sandwiched between the coarse-grained Pontiac sediments with a quartz-biotite-muscovite assemblage. These sediments are generally unmineralized, apart from beds of graphitic mudstones. These graphitic mudstones are generally found near the ultramafic contact and contain up to semi-massive sulfide (example: SUR-21-07). The mudstones are frequently silicified and locally brecciated with carbonate stringers alongside sulfide stringers, nodules, and clasts. The graphitic mudstones seem to carry higher values of zinc and copper with occasionally elevated Ni, for example SUR-21-20 has an interval within graphitic mudstones of 1.59% Zn, 0.11% Cu, 0.09% Ni and 144ppm Co over 13.25m (167.1-180.35m). There are occasional Ni values of around 0.2% Ni within the graphitic sediments.

The calc-silicate altered unit is usually found in the contact zone between the sediments and ultramafics either directly at or on the contact, or proximal to it. This unit resembles quartzite but is green to brown in colour, fine to medium grained with a plagioclase matrix containing bands of Cr-diopside – Cr-tremolite and occasional bright green Cr-grossular garnets. This unit seems to be an alteration of the ultramafics themselves and is generally very well mineralized with wide disseminations of coarse clotty sulfide, often 5-15% sulfide overall within these zones. XRF scans while logging core indicated the presence of Ni, Cu, Zn and Co. These observations were proven with assay results where wide intervals of Ni are present, ranging from 0.1 to 0.26% Ni. Copper, zinc, and cobalt values range quite a bit with up to 4.2% Zn and 0.5% Cu within this unit. Cobalt is present through most samples, generally between 80-400 ppm.

Assay results show that ultramafic units frequently contain elevated nickel contents, ranging from anomalous Ni to over 0.3% Ni. Wide bands of 0.1-0.15% Ni are frequent, although portions of these wider intervals may sometimes represent silicate Ni rather than sulfide Ni.

Highlight intervals from the 2021 DDH programs are presented in the table below.

Table 5 Notable Drillhole Intervals from the 2021 DDH Programs

DDH		From (m)	To (m)	Core Width (m)	Ni%	Cu%	Zn%	Co ppm
SUR-21-04		40.6	45	4.7			0.51

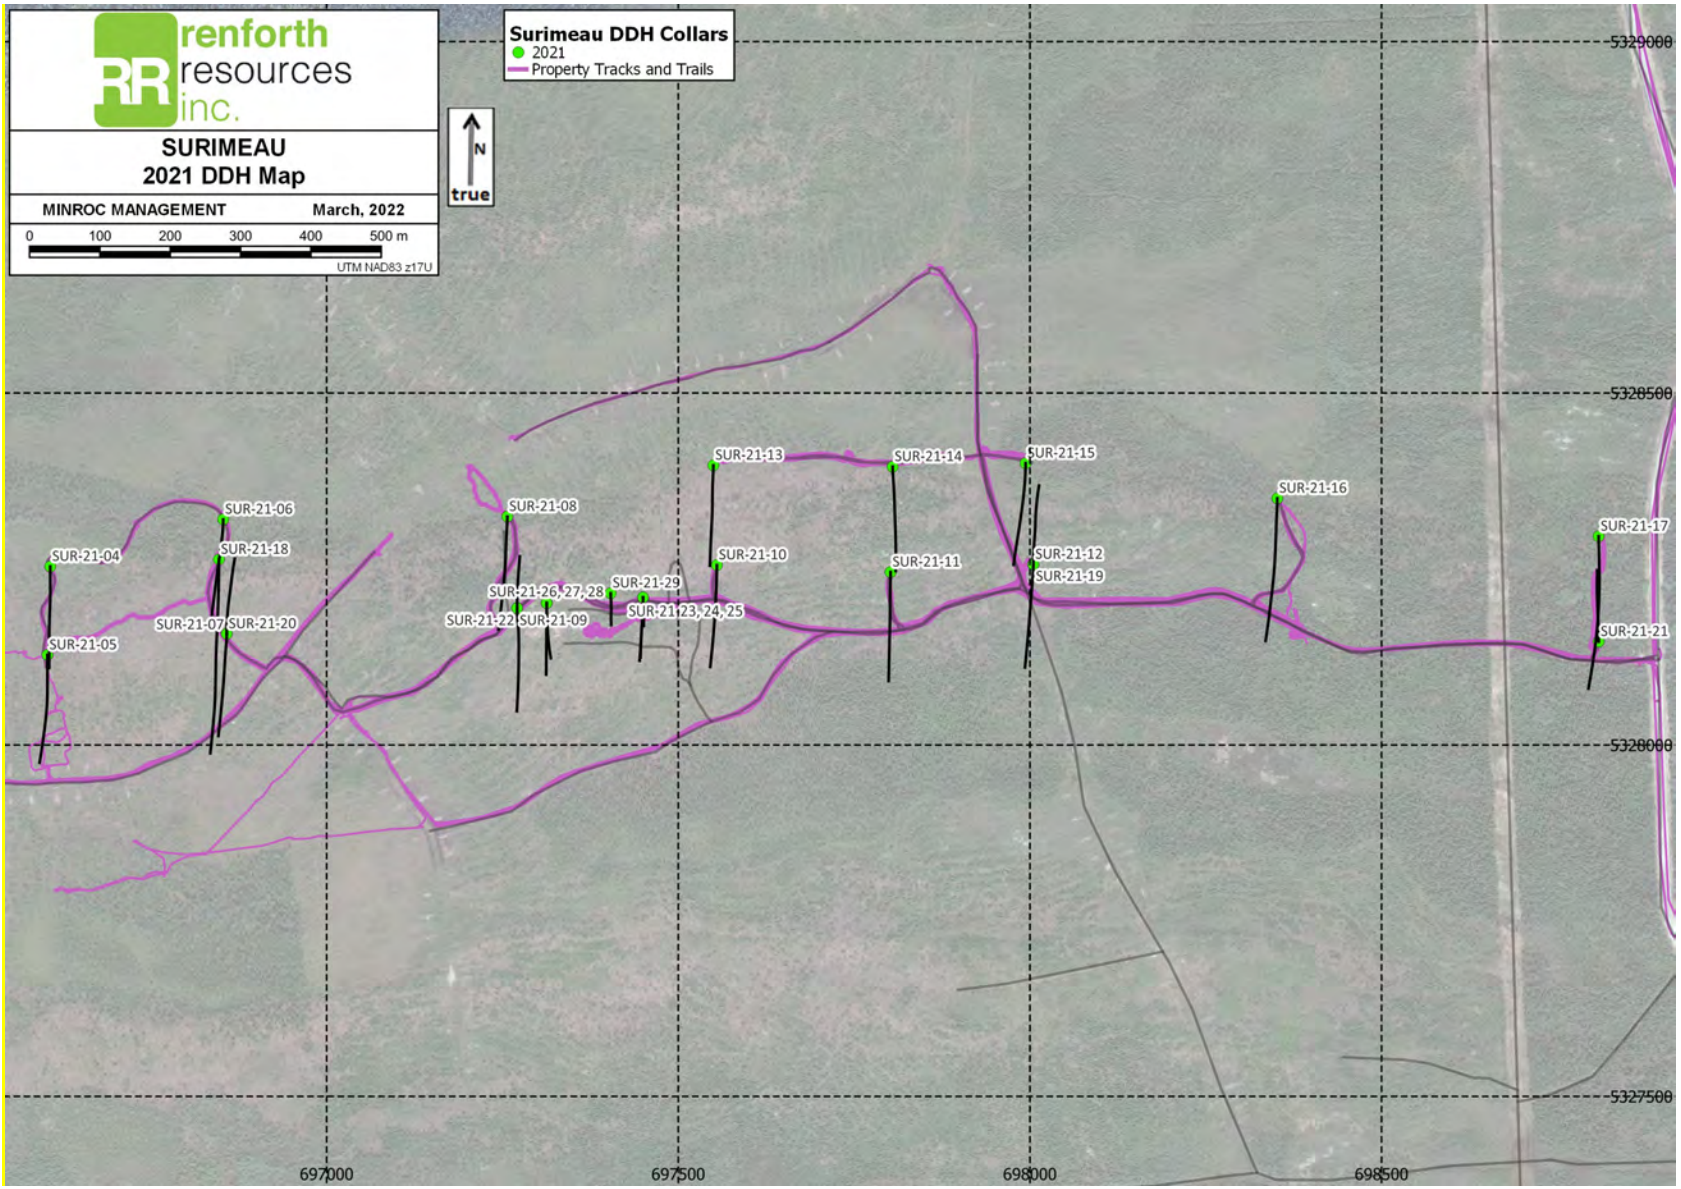

Figure 5 Locations of 2021 drillholes

10.0 SAMPLE PREPARATION, ANALYSIS AND SECURITY

Sample material was selected for sampling by Minroc geologists during logging, based on the visible or inferred presence of polymetallic mineralization. Samples taken during the March-April 2021 program were split using a standard core splitter setup manufactured by Services Exploration of Rouyn-Noranda. A splitter was chosen over a core saw due to water supply constraints. Samples taken during the June-July and December 2021 programs were cut using a diamond-blade saw. After splitting and/or cutting, sample material was placed in clear plastic bags along with a unique sample tag identifier. Assay tag numbers were also written on the outside of the bags. Samples were delivered by Minroc personnel to AGAT Laboratories in Val-d'Or throughout the program where they were tested by "201-378" Sodium Peroxide Fusion – ICP-OES/ICP-MS Finish.

AGAT ran a QA/QC regime internally alongside the sample assays, including three standards (some combination of Till-2, WMG-1a, GTS-2a, CGL-015) for multielement analysis, as well as routine duplicates. All results were reviewed by Minroc and are considered satisfactory by the authors.

AGAT facilities conform to the requirements of the ISO/IEC 17025 Standard (General requirements for the competence of testing and calibration laboratories), and regularly take part in proficiency testing. AGAT is independent of Renforth, Minroc and all other interested parties.

11.0 ADJACENT PROPERTIES

Canadian Malartic

The key adjacent property is the Canadian Malartic property which abuts it to the east. The Canadian Malartic property is a major local gold producer, producing 697,200 ounces of gold in 2018 (Agnico-Eagle 2019). In the early and mid 20th Century several mines exploited a complex series of gold deposits related to both a series of syenites and disseminated mineralized zones within the Pontiac Group, as well as a splay of the Cadillac Break: the original Canadian Malartic mine, Sladen, Barnat and East Malartic. In the 2000s these historic properties were amalgamated by Osisko Exploration who had identified a low-grade auriferous halo around the historically mined deposits. This was developed into an open pit at which commercial production began in 2011. In 2014 the Canadian Malartic property was acquired by Canadian Malartic GP, a joint venture between Agnico-Eagle and Yamana Gold. As of 2019 the pit covers about 3 km of strike, with eastern extensions at the Odyssey and Sladen deposits (in the Cadillac Break) in development (Agnico-Eagle 2019). The western portion of the deposit, which lies mostly within the Pontiac Group, is open to the west (Agnico-Eagle 2019).

Wells-Lacourcière

The Wells-Lacourcière property, held by Lithium MetalsTech, is adjacent to the Surimeau property on the south. It covers a portion of the Decelles granodiorite batholith in which northwest-trending zones of pegmatite are known to carry spodumene (lithium mica). These dykes can reach 600 m in length and 15 m width, with a spodumene content up to 5%.

The Victoria volcanic sequence strikes onto the Wells-Lacourcière property. Two drillholes were drilled here in 1965, one of which encountered notable nickel values in ultramafic units.

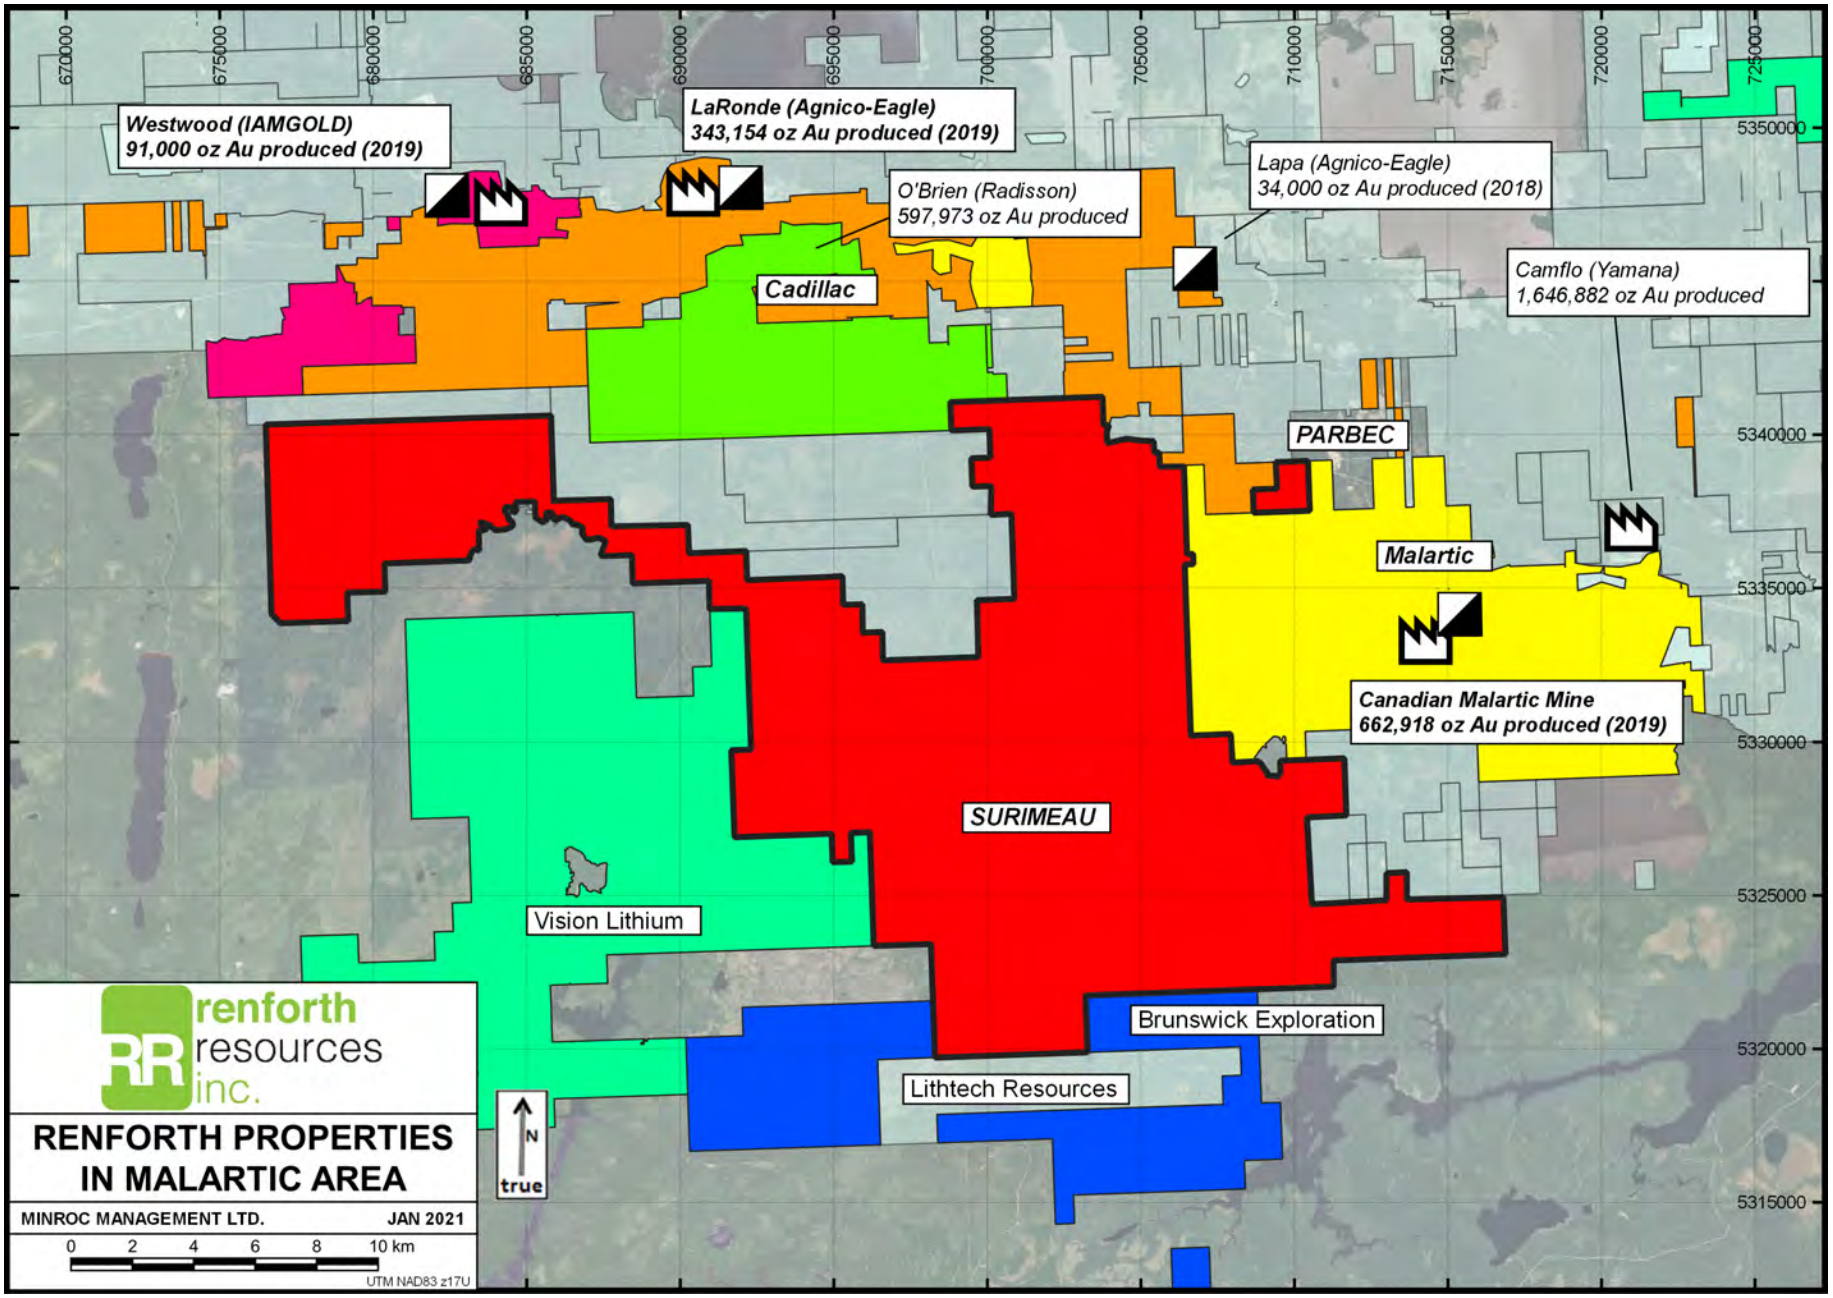

Figure 6 Adjacent Properties

12.0 INTERPRETATIONS AND CONCLUSIONS

Minroc Management Ltd was retained by Renforth Resources Inc. (Renforth) to complete a series of drill programs through 2021 in the Victoria area of the Surimeau Property near Malartic, Québec. Drilling took place in three programs, the first program took place from March 24th to April 16th, 2021, the second took place from June 14th to July 15th, 2021, and the third from December 3rd to December 13th, 2021. A total of 3,456 m was drilled from March to April 2021, 773.2 m was drilled June to July 2021 and 1,203 m was drilled in December 2021, totaling 5,432.2 m drilled between the three programs. A total of 4,507 samples were taken, including 571 QA/QC samples.

Holes drilled during the March-April program were drilled south in pairs, designed to cross the entire width of the east-west striking magnetic ultramafic body, and holes were drilled along strike of the ultramafic body to test for continuity of mineralization along strike. Some holes were also drilled to expand on the strong base-metals mineralization discovered in the December 2020 DDH program. Holes drilled during the June-July program were drilled north and were designed to test for deeper intercepts of mineralization observed in the March-April program. Holes drilled during the December program took place in the easter and western ends of the Fall 2021 trenching program in two areas which gave the strong visual mineralization and XRF field results, holes were designed to test mineralization observed at surface during the Summer 2021 trenching program as well as to test zones observed in select historic drillholes.

This drill program successfully confirmed the continuity of base metal mineralization within the ultramafics, calc-silicate alteration zones and the graphitic sediments and produced meaningful assay results in nearly all diamond drill holes warranting further exploration efforts.

Mineralization in DDH is continuous over a 2.2 km strike length, where 5 km of strike is mineralized at least at surface based on prospecting results. This strike length is co-incident with a magnetic anomaly clearly visible on government geophysics, which continues east of the current extent of drilling for approximately 15 kilometers, where it ends on the Surimeau property at the Colonie target, which hosts polymetallic mineralization based on historic assessment reports.

Mineralization seems to be related to intrusive ultramafics, carrying consistent nickel and cobalt mineralization, while the strongest copper and zinc mineralization is present in the hanging and footwall zones within the sediments and the main shear zone. Occasional mixing does occur, as evident in the assay results. Surimeau may be an Outokumpu style system in which two different mineralized bodies have been juxtaposed in one location. Both magmatic nickel deposits and volcanogenic massive sulfide deposits can form in the same district, and even in close juxtaposition, however, each form by very different, mutually incompatible mechanisms. It is possible that the nickel accumulation at Surimeau formed through a high temperature immiscible sulfide style process, and that the copper and zinc accumulations formed as a stratiform sediment-dominated sulfide system. It is clear from Outokumpu studies, as well as the descriptions of Surimeau, that it is a closely similar system. Further work must be completed to determine the true nature of the mineralization present on the property.

The Surimeau property is highly prospective for magmatic base-metal deposits. Observations made during the initial drill program in 2020 and more recently in 2021, show that mineralization is present in both the ultramafic and sedimentary units. Observed sulfide mineralization in all DDH includes chalcopyrite, pentlandite, pyrite, pyrrhotite and sphalerite. These observations were field-tested with the use of a Niton XRF and later confirmed with assay results. Mineralization was observed as broad disseminated zones within the ultramafics, as well as nodules, stringers and semi-massive zones within the graphitic sediments and calc-silicate altered zones. Mixing of sulfides, mainly pentlandite, chalcopyrite and sphalerite was present primarily in the calc-silicate altered ultramafic units, in contact zones between the sediments and ultramafics, and in the graphitic mudstone sedimentary units. These observations are consistent in nearly all holes drilled in the 2021 DDH programs.

13.0 RECOMMENDATIONS

Minroc recommends the following work be completed:

1. Further drilling to continue to expand on mineralization along strike and at depth.

2. Conducting airborne geophysics over the main focus area of the Victoria area of Surimeau to better define the extent of mineralization. This data would also be useful in planning future work.

3. If future drilling reveals zones of significant sulfide mineralization, conducting borehole electromagnetic surveys may help in determining if mineralization is strata-bound or has a structural control. Borehole EM can also identify larger sulfide masses at depth.

4. Further trenching may be warranted in order to expand on the newly exposed mineralization at surface. Alternatively, new trenches could be dug along strike either east or west of the current exposure in order to increase strike length at surface.

5. Prospecting along the entire 20 km length of the mag anomaly from the western property boundary to east of the Colonie target in the eastern extremity of the magnetic anomaly, as well as the Lalonde and Huston areas.

15.0 DATE AND SIGNATURE PAGE

I, Francis R Newton, certify that;

1. I reside at 1518 Jasmine Crescent, Oakville Ontario L6H 3H3 and I am a geologist practitioner for Minroc Management Limited, office address 2857 Sherwood Heights Unit 2, Oakville Ontario L6J 7J9.

2. This certificate applies to the technical report entitled “Report on the 2021 Diamond Drilling Program at The Surimeau Property Abitibi-Témiscamingue, Québec”, dated March 2, 2022.

3. I am a graduate of the Laurentian University, Sudbury, Ontario with a Bachelor of Science in Geology (2014) and I have practiced my profession continuously.

4. I am a member of the Order des Geologues du Quebec (OGQ) Membership Number 2129.

5. I am a member of the Association of Professional Geoscientists of Ontario (APGO), Membership Number 1330.

6. I am a qualified person.

7. I prepared and am responsible for all sections 1.0 to 16.0 of this Technical Report.

8. I am independent of Renforth Resources.

9. As of the date of this certificate, to the best of my knowledge, information and belief, this Technical Report contains all scientific and technical information that is required to be disclosed to make this Technical Report not misleading.

Effective Date: March 2, 2022

Francis R Newton, P. Geo

*Notes

Disclaimer:
- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 90 days following analysis, unless expressly agreed otherwise in writing. Please contact your Client Project Manager if you require additional sample storage time.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Measurement Uncertainty is not taken into consideration when stating conformity with a specified requirement.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.

ATTENTION TO: Brian Newton, Francis Newton

(200-) Sample Login Weight

DATE SAMPLED: Apr 02, 2021 | DATE RECEIVED: Apr 02, 2021 | DATE REPORTED: Jun 23, 2021 | SAMPLE TYPE: Drill Core

Analyte:	Sample Login Weight
Unit:	kg
Sample ID (AGAT ID) RDL:	0.01
46282 (2300875)	3.10
46283 (2300876)	3.83
46284 (2300877)	5.17
46285 (2300878)	5.09
46286 (2300879)	5.01
46287 (2300880)	5.04
46288 (2300881)	5.18
46289 (2300882)	4.84
46290 (2300883)	5.73
46291 (2300884)	1.54
46292 (2300885)	1.34
46293 (2300886)	5.58
46294 (2300887)	2.87
46295C-DUP (2300888)	-
46296 (2300889)	4.68
46297 (2300890)	5.02
46298 (2300891)	4.94
46299 (2300892)	4.95
46300 (2300893)	4.74

Comments: RDL - Reported Detection Limit

Analysis performed at AGAT 1740 Chemin Sullivan, Val d'Or, QC or 1185 Rue Des Foreurs, Val d'Or, QC (unless marked by *)

AGAT WORK ORDER: 21O731080

PROJECT: 2021 Surimeau DDH Batch 18

CLIENT NAME: MISC AGAT CLIENT QC

ATTENTION TO: Francis Newton

(200-) Sample Login Weight

DATE SAMPLED: Apr 08, 2021 | DATE RECEIVED: Apr 08, 2021 | DATE REPORTED: Sep 20, 2021 | SAMPLE TYPE: Drill Core

Analyte:	Sample Login Weight
Unit:	kg
Sample ID (AGAT ID) RDL:	0.01
46382 (2322134)	4.23
46383 (2322135)	4.17
46384 (2322136)	4.14
46385 (2322137)	4.10
46386 (2322138)	4.33
46387 (2322139)	3.73
46388 (2322140)	4.18
46389 (2322141)	4.21
46390 (2322142)	3.96
46391 (2322143)	2.22
46392 (2322144)	2.06
46393 (2322145)	4.45
46394 (2322146)	4.62
46395 C-DUP (2322147)	-
46396 (2322148)	4.18
46397 (2322149)	4.35
46398 (2322150)	4.39
46399 (2322151)	4.98
46400 (2322152)	3.04

Comments: RDL - Reported Detection Limit

Analysis performed at AGAT 1740 Chemin Sullivan, Val d'Or, QC or 1185 Rue Des Foreurs, Val d'Or, QC (unless marked by *)

PAGES (INCLUDING COVER): 22

Should you require any information regarding this analysis please contact your client services representative at (905) 501-9998

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 90 days following analysis, unless expressly agreed otherwise in writing. Please contact your Client Project Manager if you require additional sample storage time.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Measurement Uncertainty is not taken into consideration when stating conformity with a specified requirement.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.

*Notes

Disclaimer:
- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 90 days following analysis, unless expressly agreed otherwise in writing. Please contact your Client Project Manager if you require additional sample storage time.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Measurement Uncertainty is not taken into consideration when stating conformity with a specified requirement.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.
